w. p. 1

PREFACE.

This work has been prepared for the use of beginners in the study of trigonometry. Assuming that a high degree of proficiency cannot be expected from such students, the author has limited himself to the selection of simple proofs of the formulas, not striving after original demonstrations. Geometrical proofs have been added in many cases, experience having shown that the student is assisted by them to a clearer understanding of the subject.

The student is expected, in technical institutions, to acquire facility in the use of the tables. All of the numerical examples have been computed by the author, with special attention to correctness in the last decimal place, and the arrangement of the computations has been carefully considered. Five-place tables have been adopted, and the angles in the examples are given to the nearest tenth of a minute, because the instruments ordinarily used by engineers are read by the vernier only to the nearest minute of arc, while the angle corresponding to a computed function may be found usually to the nearest tenth of a minute by the use of five-place tables.

Credit is due particularly to the works of Chauvenet, Snowball, Beasley, Woodhouse, Newcomb, and Todhunter, although many others have been consulted. A number of the illustrative examples in Art. 111 were taken from Gillespie's "Land Surveying," the numerical values being assigned by the author of that work.

The author cannot hope that among so many examples there are no errors; he therefore requests those finding such to kindly notify him.

PART ONE.

PLANE AND ANALYTICAL TRIGONOMETRY.

CHAPTER I.

MEASUREMENT OF ANGLES; TRIGONOMETRIC FUNCTIONS OF ANGLES LESS THAN NINETY DEGREES.

- 1. Analytical Trigonometry treats of the relations of lines and angles by algebraic methods. In Plane and Spherical Trigonometry, these relations are applied to the solution of plane and spherical triangles.
- 2. Directed Lines; Angles. A directed line is one whose beginning, direction, and length are known. The direction of the line is indicated by the order of the letters in its symbol; for instance, the line AB is drawn from A to B. If one direction along the line is considered positive, the opposite direction will be negative; thus, if the line AB is positive, the line BA will be negative, their numerical measures being equal, or

line AB = - line BA.

An angle is the figure formed by two intersecting lines, the point of intersection being the vertex.

The angle between any two given lines, whether intersecting or not intersecting,* is defined to be the same as the angle formed by two lines drawn through any point parallel to and in the same direction as the given lines. Hence an angle may be defined as the difference in direction of two directed lines.

^{*} That is, parallel or in space.

- 3. Measurement of Angles. Two methods of measuring angles are in common use, the sexagesimal and the circular or natural methods.
- 4. Sexagesimal Measure.*—The circumference of a circle described about the vertex of the angle as a center is divided into 360 equal parts, and the angle at the center subtended by one of these parts is taken as the unit. The length of one of these divisions of the circle will depend upon its radius; but the corresponding angle at the center will be independent of the radius, since it is $\frac{1}{360}$ of four right angles. This unit angle, called a degree, is divided into 60 parts called minutes, each of which is subdivided into 60 parts called seconds. These are marked °, ', "; thus 43° 14′ 35".2 is read, "43 degrees, 14 minutes, and 35.2 seconds."

How many degrees are there in

1.	Two	thirds	of four	right	angles?	Ans.	240°.
----	-----	--------	---------	-------	---------	------	-------

2. Two fifths of three right angles?

Ans. 108°.

3. Five sixths of two right angles?

Ans. 150°.

5. The Circular or Natural Measure. — From geometry we

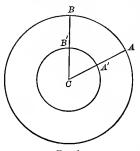

Fig. 1.

know that in any two concentric circles the arcs intercepted by any angle at the center are to each other as the radii of the circles. Therefore, if ACB be any central angle, we have

$$\frac{\operatorname{arc} AB}{CA} = \frac{\operatorname{arc} A'B'}{CA'}$$
 (1)

Hence the length of the intercepted arc divided by the radius is a number that is always the same for the same

angle, no matter what the radius may be.

We also know that in any circle any two central angles are to each other as their intercepted arcs, and therefore as the quotients of their intercepted arcs divided by the radius. We can, then, use these quotients to measure the angles.

^{*} From sexagesimus, sixtieth.

The circular measure of an angle is the quotient obtained by dividing the length of its intercepted arc, in a circle whose center is at the vertex of the angle, by the radius of the circle. Thus, if c is the circular measure of the angle, l its intercepted arc, and r the radius, we have

$$c = \frac{l}{r}.$$
 (2)

If the radius of the circle is unity,

$$c = l$$
. (3)

Hence the circular measure is represented by the length of the intercepted arc in the circle whose radius is unity.

The angle whose circular measure is one, that is, whose intercepted arc is equal to the radius, is called the radian.

- 1. The length of the intercepted arc of a central angle is 4 feet in a circle whose radius is 2 feet; the length of the intercepted arc of another central angle is 20 meters in a circle whose radius is 5 meters. Show that the second angle is twice as large as the first.
- 2. In a circle with a radius of 10 inches, the intercepted arc of a central angle is 5 inches, and that of an angle whose vertex is on the circumference is 10 inches. Find their circular measures.

 Ans. $\frac{1}{2}$.
- 6. Relation between the Two Measures. Two right angles are measured by 180°, and also by $\pi r^* \div r = \pi$, since πr is the semicircumference of a circle whose radius is r. Hence, using the equality sign to represent "corresponds to," we have

$$180^{\circ} = \pi$$
 in circular measure; (1)

$$1^{\circ} = \frac{\pi}{180} \text{ in circular measure.}$$
 (2)

Again, π in circular measure = 180°; (3)

... 1 in circular measure =
$$\frac{180^{\circ}}{\pi}$$
. (4)

... 1 in circular measure =
$$57^{\circ}.29577.95 + (5)$$

... 1 in circular measure =
$$206\ 264''.806$$
. (6)

1. What is the circular measure of 120°? Ans. $120 \times \frac{\pi}{180} = \frac{2}{3} \pi$.

2. What is the circular measure of 10° 10′ 10″?

The circular measure of 1° is $\frac{\pi}{180}$, and that of 1" is $\frac{\pi}{180 \times 60 \times 60}$. But

10° 10′ 10″ = 36610″. ... Circular measure of 10° 10′ 10″ =
$$\frac{36610 \pi}{180 \times 60 \times 60}$$

^{*} π denotes the ratio of the circumference of a circle to its diameter, and is the number 3.14159 265+.

- 3. What is the sexagesimal measure of the angle whose circular measure is $\frac{1}{3}\pi$? $\pi=180^\circ; \qquad \frac{1}{3}\pi=60^\circ.$
- 4. What is the sexagesimal measure of the angle whose circular measure is $\frac{2}{3}$?

 Unity in circular measure $=\frac{180^{\circ}}{\pi}$; $\therefore \frac{2}{3}$ corresponds to $\frac{120^{\circ}}{\pi}$.
- 5. What are the sexagesimal and circular measures corresponding to $\frac{2}{9}$ of three right angles?

 Ans. 60°; $\frac{1}{3}\pi$.
- 6. The sexagesimal measures of two angles are 22°30′ and 48°14′3″. Show that their circular measures are $\frac{1350~\pi}{180\times60}$ and $\frac{155643~\pi}{180\times60\times60}$.
- 7. The circular measures of three augles are $\frac{1}{12}\pi$, $\frac{2}{9}\pi$, and $\frac{1}{50}\pi$. Show that their sexagesimal measures are 15°, 40°, and 3° 36′.
- 8. The circular measures of three angles are $\frac{1}{4}$, $\frac{5}{3}$, and $\frac{2}{9}$. Show that their sexagesimal measures are $\frac{45^{\circ}}{\pi}$, $\frac{300^{\circ}}{\pi}$, and $\frac{40^{\circ}}{\pi}$.
 - 9. Find the sexagesimal and circular measures corresponding to
 - (a) Seven tenths of four right angles. Ans. 252° ; $\frac{7}{5}\pi$.
 - (b) Five fourths of two right angles. Ans. 225° ; $\frac{5}{4}\pi$.
 - (c) Two thirds of one right angle. Ans. 60° ; $\frac{1}{8}\pi$.
- 7. Centesimal Measure. In this system, proposed by the French, the right angle is divided into 100 parts called grades, each of which is subdivided into 100 parts called minutes, each minute being divided into 100 parts called seconds; marked ^g, `, ``.
- 8. Trigonometric Ratios. Let the sides of a right-angled triangle be denoted as shown in Fig. 2. The trigonometric ratios may be defined as follows:

The sine of an angle =
$$\frac{\text{side opposite}}{\text{hypotenuse}}$$
; written $\sin A = \frac{o}{h}$

The cosine of an angle = $\frac{\text{side adjacent}}{\text{hypotenuse}}$; written $\cos A = \frac{a}{h}$

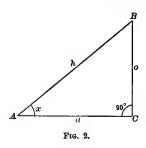

The tangent of an angle = $\frac{\text{side opposite}}{\text{side adjacent}}$; written $\tan A = \frac{o}{a}$

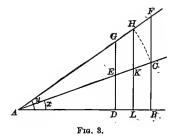

The cotangent of an angle = $\frac{\text{side adjacent}}{\text{side opposite}}$; written $\cot A = \frac{a}{a}$

The secant of an angle = $\frac{\text{hypotenuse}}{\text{side adjacent}}$; written $\sec A = \frac{h}{a}$

The cosecant of an angle = $\frac{\text{hypotenuse}}{\text{side opposite}}$; written $\csc A = \frac{h}{a}$

These fundamental equations should be thoroughly memorized.

9. The Ratios are Constant for Any One Angle. — In Fig. 3 let BAC and BAF be two angles differing by a quantity as small as we please. At any two points B and D on AB, draw BF and DG perpendicular to AB; with A as a center, and radius AC, describe the arc CH, and draw LH perpendicular to AB. The triangles BAC and DAE are similar.

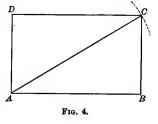

10. The Values of the Ratios differ for Different Angles. — From Fig. 3 we have, since AH = AC,

$$\sin x = \frac{BC}{AC} \text{ and } \sin y = \frac{LH}{AH} = \frac{LH}{AC};$$

$$\tan x = \frac{BC}{AB} \text{ and } \tan y = \frac{BF}{AB};$$

$$\sec x = \frac{AC}{AB} \text{ and } \sec y = \frac{AF}{AB}.$$

11. The Angle may be constructed when One of the Ratios is known.—
Let $\sin x = \frac{1}{2}$. With any convenient radius AC, describe a circle about A as a center. Draw AD perpendicular to AB, and on it lay off $AD = \frac{1}{2}AC$; draw DC parallel to AB until

it intersects the circle at C; join A and C, and BAC will be the required angle, since

$$\sin BAC = \frac{BC}{AC} = \frac{AD}{AC} = \frac{1}{2}.$$

Let $\tan x = \frac{3}{4}$. Lay off any convenient distance AB; at B draw BC perpendicular to AB, and lay off $BC = \frac{3}{4}AB$; join A and C, and BAC will be the required angle, since

$$\tan BAC = \frac{BC}{AB} = \frac{3}{4}.$$

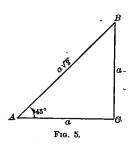

Let $\sec x = 2$. Lay off any convenient distance AB; erect the perpendicular line BC; with a radius AC = 2AB describe an arc cutting BC at C; join A and C, and BAC will be the required angle, since

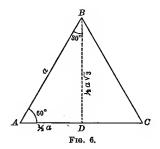

$$\sec BAC = \frac{AC}{AB} = 2.$$

Let the student construct the angle whose cosine is $\frac{1}{3}$, the angle whose co-tangent is 5, and the angle whose cosecant is 4.

- 12. We therefore conclude that to any one angle there will correspond a special value of each of these ratios, that the value of each ratio will differ for different angles, and that, if any one of these ratios is given, the angle may be constructed.
- 13. Tables of Sines, Cosines, etc. The values of these ratios for angles between 0° and 90° have been computed, and are given in tables so arranged that the values corresponding to any angle may be readily found. The tables of natural sines, etc., contain the actual values of these ratios; while the tables of logarithmic sines, etc., contain their logarithms.
 - 14. Ratios for 30°, 45°, 60°.
- (a) Ratios for 45°. In Fig. 5 let the angle $A=45^{\circ}$; then $B=90^{\circ}-A=45^{\circ}$.
 - \therefore A C = CB, since they are opposite equal angles.

Let
$$AC = a$$
; then $CB = a$, and $AB = \sqrt{a^2 + a^2} = a\sqrt{2}$.

(b) Ratios for 30° and 60°.—In the equilateral triangle ABC (Fig. 6), let AB = a; draw DB perpendicular to AC; AC will be bisected at D, making $AD = \frac{1}{2}a$, and the angle ABD = angle DBC = 30°.

Also
$$DB = \sqrt{a^2 - \frac{1}{4} a^2} = \frac{1}{2} a \sqrt{3}$$
.

Note that the sines of 30°, 45°, and 60°, are $\frac{1}{2}\sqrt{1}$, $\frac{1}{2}\sqrt{2}$, and $\frac{1}{2}\sqrt{3}$ respectively.

15. The Ratios are not Independent of Each Other; for we have from Fig. 2, $h^2 = a^2 + o^2$.

so that if two of the three quantities h, o, and a, are given, the third can be found. Hence if we know one of the ratios, that is, the relative values of two of the three elements, we can determine the relative value of the third element, and from it the other ratios.

14 PLANE AND ANALYTICAL TRIGONOMETRY.

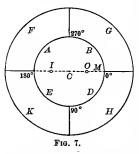

Thus if $\tan x = \frac{3}{4}$, and the other ratios are required, we have

$$\tan x = \frac{o}{a} = \frac{3}{4}$$
; let $o = 3$, $a = 4$; then $h = 5$.
 $\therefore \sin x = \frac{o}{h} = \frac{3}{5}$; $\cos x = \frac{a}{h} = \frac{4}{5}$; $\cot x = \frac{a}{o} = \frac{4}{3}$; $\sec x = \frac{h}{a} = \frac{5}{4}$; $\csc x = \frac{h}{a} = \frac{5}{3}$.

Having given the ratio on the left, find the ratios on the right:

		sin æ.	cos x.	tan æ.	cot æ.	sec a.	cosec æ
1.	17	_	15 17	8 15	15 8	17 15	17 8
2.	$\cos x = \frac{5}{13} \cdot \cdot \cdot \cdot \cdot$	$\frac{12}{13}$	_	$\frac{12}{5}$	$\frac{5}{12}$	$\frac{13}{5}$	$\frac{13}{12}$
3.	$\tan x = \frac{7}{24} \cdot \cdot \cdot \cdot \cdot$	$\frac{7}{25}$	$\frac{24}{25}$	_	$\frac{24}{7}$	$\frac{25}{24}$	$\frac{25}{7}$
4.	$\cot x = 2 \dots \dots$	$\frac{1}{\sqrt{5}}$	$\frac{2}{\sqrt{5}}$	$rac{1}{2}$	_	$\frac{1}{2}\sqrt{5}$	√5
5.	$\sec x = \frac{29}{20} \cdot \cdot \cdot \cdot$	$\frac{21}{29}$	$\frac{20}{29}$	$\frac{21}{20}$	$\frac{20}{21}$	_	$\frac{29}{21}$
6.	$\csc x = 3 \dots \dots$	$\frac{1}{3}$	$\frac{2}{3}\sqrt{2}$	$\frac{1}{4}\sqrt{2}$	$2\sqrt{2}$	$\frac{3}{4}\sqrt{2}$	_

16. Measurement of Angles in the Field.—In Fig. 7, FGHK represents a fixed graduated circle, and ABDE a circle resting on the plate FGHK, and capable of moving about a pivot at C; I and O are two small rods fixed to

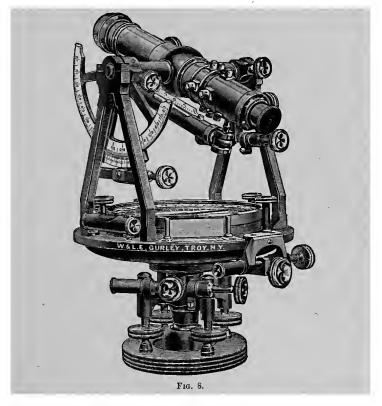

ABDE, and perpendicular to the planes of the circles; and M is a mark on the circle ABDE in the same line with I, C, and O. If we wish to measure the horizontal angle between two distant objects, two church towers, for example, we proceed as follows: first place the circles in a horizontal position; revolve the circle ABDE, looking along the line IO, until the line of

sight passes through one of the objects, and note the reading

of the circle opposite the mark M; then revolve the circle ABDE, being careful not to move FGHK, until the line of sight passes through the second object, and note the new reading of the circle opposite the mark M. The difference between the two readings will be the angular distance required.

17. The Engineers' Transit, shown in Fig. 8, is used in measuring horizontal and vertical angles. The lower circle is provided with two levels, by which its horizontality is tested.

The rods I and O are replaced by the telescope with a system of intersecting wires in the common focus of the object glass and eyepiece, the telescope being capable of rotation about an axis parallel to the horizontal circle. The circle fixed to the axis of the telescope is vertical when the plate bearing the upright supports is horizontal.

18. Illustrations of the Application of the Ratios.*

1. A rope fastened to the top of a vertical pole 60 feet high, and to a stake driven in the ground, is inclined at an angle of 30°. How far is the stake from the bottom of the pole? How long is the rope?

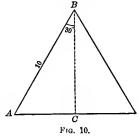

$$\frac{CB}{AC} = \tan 30^{\circ} = \frac{1}{\sqrt{3}}.$$

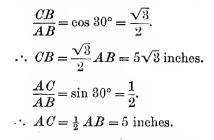

$$\therefore AC = \sqrt{3} CB = 60\sqrt{3} \text{ feet.}$$

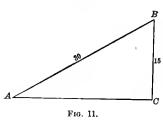

$$\frac{CB}{AB} = \sin 30^{\circ} = \frac{1}{2}.$$

AB = 2 CB = 120 feet.

2. The angle at the vertex of a right circular cone is 60°, and the slant height is 10 inches. What is the altitude and the radius of the base of the cone?

3. The top of a ladder 30 feet long rests on the upper edge of a wall 15 feet high. What is the inclination of the ladder?

$$\sin CAB = \frac{CB}{AB} = \frac{15}{30} = \frac{1}{2};$$

but $\sin 30^{\circ} = \frac{1}{2}. \therefore CAB = 30^{\circ}.$

In these cases the ratios corresponding to the angles were known from Art. 14. Usually it will be necessary to refer to the tables in solving problems involving the ratios.

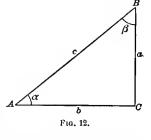

^{*} It is assumed that the ground is horizontal.

CHAPTER II.

RIGHT PLANE TRIANGLES.

- 19. It has been shown in Geometry that a right-angled triangle can be constructed when two elements * besides the right angle are known, one of the known elements being a side. We also know that
- (1) The hypotenuse is greater than either of the other two sides.
- (2) The hypotenuse is less than the sum of the other two sides.
 - (3) The sum of the two acute angles must be 90°.
 - (4) The greater side is opposite the greater angle.
- (5) The square on the hypotenuse is equal to the sum of the squares on the other two sides.
- 20. A triangle is said to be *solved* when, having some of the elements given, the others have been found by some process.
- 21. The Solution of a Right Triangle is effected by means of

the trigonometric ratios. Each equation, as $\sin A = \frac{a}{c}$ contains three quantities; and two of them must be known in order that the third may be found. Hence in any particular case we use the equations that contain the two given elements; thus, if a and b are given, we use $\tan A = \frac{a}{b}$

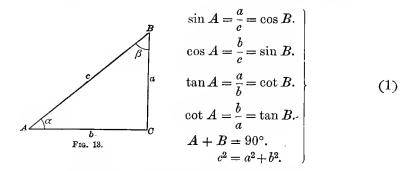

to find A, and then c may be found from either $\sin A = \frac{a}{c}$ or $\cos A = \frac{b}{c}$.

* The elements of a triangle are the three sides and the three angles.

CROCK. TRIG. — 2 17

The equations used in the solution of right triangles are

22. From the Trigonometric Ratios we have

$$\tan A = \frac{a}{b}; \quad \therefore \quad a = b \tan A, \\
\cot B = \frac{a}{b}; \quad \therefore \quad a = b \cot B,$$
(1)

or, any side of a right triangle is equal to the other side multiplied by the tangent of the angle opposite, or by the cotangent of the angle adjacent, to the side itself.

$$\sin A = \frac{a}{c}; \quad \therefore \quad a = c \sin A,
\cos B = \frac{a}{c}; \quad \therefore \quad a = c \cos B,$$
(2)

or, any side is equal to the hypotenuse multiplied by the sine of the opposite angle, or by the cosine of the adjacent angle.

$$\sec A = \frac{c}{b}; \quad \therefore c = b \sec A, \\
\csc B = \frac{c}{b}; \quad \therefore c = b \csc B,$$
(3)

or, the hypotenuse is equal to a side multiplied by the secant of the adjacent angle, or by the cosecant of the opposite angle.

Note. — The secant of an angle is the reciprocal of its cosine, and the cosecant is the reciprocal of its sine; hence the logarithm of the secant is the arithmetical complement of that of the cosine, and the logarithm of the cosecant is the A. C. of that of the sine, or

 $\log \sec x = \operatorname{colog} \cos x$, and $\log \operatorname{cosec} x = \operatorname{colog} \sin x$.

23. Case I. Given c and A.

Formulas: $\begin{cases} a = c \sin A, \\ b = c \cos A, \\ B = 90^{\circ} - A. \end{cases}$

1. Solve the triangle when c = 1.0034, and $A = 42^{\circ} 10'.3$.

$$B = 90^{\circ} - A = 47^{\circ} 49'.7.$$

(a) By natural functions.

$$a = c \sin A = 1.0034 \times 0.67136 = 0.67364.$$

 $b = c \cos A = 1.0034 \times 0.74114 = 0.74366.$

(b) By the use of logarithms.

$$a = c \sin A$$
; $\therefore \log a = \log c + \log \sin A$.
 $b = c \cos A$; $\therefore \log b = \log c + \log \cos A$.

Always write first all the formulas that will be used in the problem; then write them in a form adapted to logarithmic computation; then refer to the tables and write the logarithms in their proper places. Thus in this case we arrange the work as follows:

The positive signs preceding $\log \sin A$ and $\log \cos A$ indicate that they are to be added to $\log c$.

We now find the angle A in the table of logarithmic functions and take from the table both $\log \sin A$ and $\log \cos A$, writing them in their proper places. Then we refer to the table of logarithms of numbers and find $\log c$, writing it opposite $\log c$. Then we add the proper quantities to find $\log a$ and $\log b$, finally looking in the table of the logarithms of numbers for the numbers corresponding to the computed values of $\log a$ and $\log b$.

The arrangement on the right is preferable, since it saves

the writing of one line. The numbers in the parentheses indicate the order in which the quantities should be found.

$$\log c = 0.00147 \qquad \log c = 0.00147 \qquad \text{or } \log \sin A = 9.82695 - 10$$

$$\log a = 9.82695 - 10 \qquad \log b = 9.87137 - 10 \qquad \log \cos A = 9.86990 - 10$$

$$a = 0.67363 \qquad b = 0.74365 \qquad \log a = 9.82842 - 10$$

$$C + b = 1.74705 \qquad c - b = 0.25975$$

$$\log (c + b) = 0.24230$$

$$\log (c +$$

Exact agreement is not expected, since the tables give the values of the functions only to the *nearest* unit in the fifth decimal place. The -10 is usually omitted, and $\sin A$ is written for $\log \sin A$, when there is no danger of confusion.

2. Solve the triangle when c = 34.687, and $B = 49^{\circ} 8'.4$.

Ans.
$$A = 40^{\circ} 51'.6$$
; $b = 26.234$; $a = 22.6925$.

- 3. Solve the triangle when c=305, and $A=63^{\circ}\,31'.14$, using the natural functions. $Ans. \ \alpha=273.00\ ;\ b=136.00.$
- 4. Solve the triangle when c=205, and $B=49^{\circ}33'.01$, using the natural functions.

 Ans. a=133.00; b=156.00.

24. Case II. Given c and a.

Formulas:
$$\begin{cases} \sin A = \frac{a}{c}, \\ b = a \cot A = c \cos A, \\ B = 90^{\circ} - A, \end{cases}$$

1. Solve the triangle when c = 8.7982, and a = 3.1292.

or * log cot
$$A = 0.41958$$
 (5) Check: $b^2 = (c - a)(c + a)$
 $log a = 0.49544$ (1) $c - a = 5.6690$, $log (c - a) = 0.75351$
 $-log c = 0.94439$ (2) $c + a = 11.9274$, $log (c + a) = 1.07655$
 $log cos $A = 9.97063$ (6) $log b^2 = 1.83006$
 $log sin $A = 9.55105$ (1) -(2) $log b = 0.91503$
 $A = 20^{\circ} 50'.1$ (4) $B = 69^{\circ} 9'.9$
 $log b = 0.91502$ $\begin{cases} (1) + (5) \\ (2) + (6) \end{cases}$$$

2. Solve the triangle when c = 369.27, and b = 235.64.

Ans.
$$A = 50^{\circ} 20'.9$$
; $B = 39^{\circ} 39'.1$; $a = 284.31$.

3. Solve the triangle when c = 281, and a = 160, using the natural functions.

Ans.
$$A = 34^{\circ} 42'.5$$
; $b = 231.00$ or 231.01.

4. Solve the triangle when c=365, and b=76, using the natural functions. $Ans. \ A=77^{\circ} 58'.93$; a=357.00.

25. Case III. Given a and b.

Formulas:

$$\begin{cases} \tan A = \frac{a}{b}, \\ c = \frac{a}{\sin A} = \frac{b}{\cos A}, \\ B = 90^{\circ} - A. \end{cases}$$

1. Solve the triangle when a = 169.03, and b = 203.44.

... $\log \tan A = \log a - \log b$; $\log c = \log a - \log \sin A = \log b - \log \cos A$.

$$\log a = 2.22796 \qquad \log a = 2.22796 \qquad \log b = 2.30843$$

$$-\log b = 2.30843 \qquad -\log \sin A = 9.80555 - 10 \qquad -\log \cos A = 9.88602 - 10$$

$$\log \tan A = 9.91953 - 10 \qquad \log c = 2.42241 \qquad \log c = 2.42241$$

$$A = 39^{\circ} 43'.3 \qquad c = 264.49 \qquad c = 264.49$$
or
$$8 = 50^{\circ} 16'.7 \qquad \text{Check: } a^{2} = c^{2} - b^{2}$$

$$\log \sin A = 9.80555 \qquad (5) \qquad c + b = 467.93$$

*
$$\log a = 2.22796$$
 (1) Check: $a^2 = c^2 - b^2$
 $\log \sin A = 9.80555$ (5) $c + b = 467.93$
 $\log \cos A = 9.88602$ (6) $c - b = 61.05$
 $\log b = 2.30843$ (2) $\log (c + b) = 2.67018$
 $\therefore \log \tan A = 9.91953$ (3) $\log (c - b) = 1.78569$
 $A = 39^{\circ} 43'.3$ (4) $\log a = 2.22794$
 $\log c = 2.42241$ $\begin{cases} (1) - (5) \\ (2) - (6) \end{cases}$

^{*} This form is preferable.

2. Solve the triangle when a = 4.8199, and b = 2.6492.

Ans.
$$A = 61^{\circ} 12'.3$$
; $B = 28^{\circ} 47'.7$; $c = 5.4999$.

3. Solve the triangle when a=60, and b=91, using the natural functions.

Ans.
$$A = 33^{\circ} 23'.9$$
; $c = 109.00$.

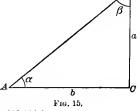

4. Solve the triangle when a = 72, and b = 65, using the natural functions.

Ans.
$$A = 47^{\circ} 55'.5$$
; $c = 97.000$.

26. Case IV. Given a and A.

Formulas:

$$\begin{cases} b = a \cot A, \\ c = \frac{a}{\sin A} = \frac{b}{\cos A}, \\ B = 90^{\circ} - A. \end{cases}$$

1. Solve the triangle when a = 613.35, and $A = 40^{\circ} 12'.6$.

$$B = 90^{\circ} - A = 49^{\circ} 47'.4.$$

$$\log b = \log a + \log \cot A.$$

 $\log c = \log a - \log \sin A = \log b - \log \cos A.$

or
$$\log \sin A = 9.80996$$
 (1) Check: $a^2 = (c+b)(c-b)$
 $\log a = 2.78770$ (3) $c+b = 1675.56$, $\log (c+b) = 3.22416$
 $\log \cot A = 0.07295$ (2) $c-b = 224.52$, $\log (c-b) = 2.35126$
 $\log c = 2.97774$ (3) -(1) $\log a^2 = 5.57542$
 $\log b = 2.86065$ (3) +(2) $\log a = 2.78771$

2. Solve the triangle when a = 3.6378, and $B = 69^{\circ} 23'.5$.

Ans.
$$A = 20^{\circ} 36'.5$$
; $b = 9.6738$; $c = 10.335$.

3. Solve the triangle when b=160, and $A=55^{\circ}\,17'.48$, using the natural functions. Ans.~c=281.00; $\alpha=231.00$.

4. Solve the triangle when a=340, and $A=60^{\circ}$ 55'.85, using the natural functions.

Ans. c=389.00; b=189.00.

27. Isosceles Triangles. — If a perpendicular to the base is drawn from the vertex, it will bisect the base and the angle at the vertex, forming two equal right triangles.

A

$$\angle ABD = \angle DBC = \frac{1}{2}\bar{\beta}; \ AB = BC;$$

$$AD = DC = \frac{1}{2}b.$$

1. Solve the triangle when b=2.1452, and $\beta=121^{\circ}14'.6.$

$$AD = 1.0726; ABD = 60^{\circ} 37'.3;$$

$$a = 90^{\circ} - \frac{1}{2}\beta = 29^{\circ} 22'.7.$$

$$Fro. 16.$$

$$a = \frac{\frac{1}{2}b}{\sin{\frac{1}{2}\beta}}; \quad . \quad \log{a} = \log{\frac{1}{2}b} - \log{\sin{\frac{1}{2}\beta}}.$$

$$p = \frac{1}{2}b \cot{\frac{1}{2}\beta}; \quad . \quad \log{p} = \log{\frac{1}{2}b} + \log{\cot{\frac{1}{2}\beta}}.$$

$$\log{\frac{1}{2}b} = 0.03044 \qquad \qquad \log{\frac{1}{2}b} = 0.03044$$

$$-\log{\sin{\frac{1}{2}\beta}} = 9.94022 - 10 \qquad \qquad +\log{\cot{\frac{1}{2}\beta}} = 9.75049 - 10$$

$$\log{a} = 0.09022 \qquad \qquad \log{p} = 9.78093 - 10$$

$$a = 1.2309 \qquad \qquad p = 0.60385$$

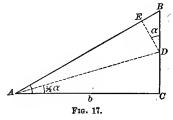

2. Solve the triangle when $\alpha = 52^{\circ} 10'.2$, and $\alpha = 600.2$.

Ans.
$$\beta = 75^{\circ} 39'.6$$
; $\frac{1}{2}b = 368.12$; $p = 474.07$.

28. Given c and b (Special Method). — When b nearly equals c, the angle found from the formula $\cos A = \frac{b}{c}$ is uncertain, the

tabular difference for the cosine being so small that a small error in $\cos A$ would produce a large error in A.

In the figure, AD bisects the angle A, and DE is perpendicular to AB; $\therefore DE = CD$. Let CD = x = DE;

$$\therefore \tan \frac{1}{2} \alpha = \frac{x}{h} \tag{1}$$

Also,
$$CB = a = CD + DB = CD + DE \sec \alpha;$$

$$\therefore a = x + x \sec \alpha; \quad \therefore x = \frac{a}{1 + \sec \alpha};$$

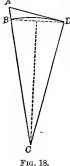

$$\therefore x = \frac{a}{1 + \frac{c}{b}} = \frac{ab}{c + b}.$$
(2)

From (1) and (2),

$$\tan \frac{1}{2} \alpha = \frac{a}{c+b} = \frac{\sqrt{c^2 - b^2}}{c+b} = \sqrt{\frac{(c+b)(c-b)}{(c+b)^2}};$$

$$\therefore \tan \frac{1}{2} \alpha = \sqrt{\frac{c-b}{c+b}}.$$
(3)

Suppose that we wish to find the greatest distance at sea at which a mountain 4.3 miles high can be seen, the earth being considered as a sphere with a radius of 3963.3 miles, and the distance being measured as a chord.

Let BA=4.3, and CB=CD=3963.3; BD being the distance required. Then $\cos DCA=\frac{CD}{CA}$, giving $\log \cos DCA=9.99952$; and DCA as found from the tables might have any value between 2° 40′.5 and 2° 42′.5.

Using (3), we have

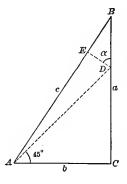

$$CA - CD = 4.3$$
; $\log = 0.63347$
 $CA + CD = 7930.9$; $\log = 3.89932$
 $2)6.73415 - 10$
 $\log \tan \frac{1}{2}DCA = 8.36708 - 10$
 $Cpl. \ T' = 3.53620$
 $\log (\frac{1}{2}DCA)' = 1.90328$

$$1.1 DCA = 80'.035$$
; $1.1 DCA = 2^{\circ} 40'.07$.

Then $BD=2CD\sin\frac{1}{2}DCA$ will give the chord BD. The arc BD is found from the proportion: $360^{\circ}\colon DCA=2\ \pi\ \times\ 3963.3\colon {\rm arc}\ BD$.

Note. — Eq. (3) follows directly from (4), Art. 69:

$$\tan \frac{1}{2} a = \sqrt{\frac{1 - \cos a}{1 + \cos a}}$$
, where $\cos a = \frac{b}{c}$

29. Given a and b (Special Method). —

When a and b are nearly equal, the angle a may be determined more accurately, as follows:

Draw AD, making $CAD = 45^{\circ}$, and DE perpendicular to AB. Then

$$\tan DAE = \tan(\alpha - 45^{\circ}) = \frac{DE}{AE}.$$

But
$$DE = DB \cos \alpha = (CB - CD) \cos \alpha$$

= $(a - b) \cos \alpha = \frac{(a - b)b}{a}$,

and

$$AE = AB - EB = AB - DB \sin \alpha = c - \frac{(a-b)a}{c} = \frac{c^2 - a^2 + ab}{c}$$

$$= \frac{b^2 + ab}{c}$$

$$\therefore \frac{DE}{AE} = \frac{(a-b)b}{ab+b^2} = \frac{a-b}{a+b}.$$

$$\therefore \tan (\alpha - 45^\circ) = \frac{a-b}{a+b}.$$
(1)

If b were greater than a, the formula would be

$$\tan\left(45^\circ - a\right) = \frac{b-a}{b+a}.\tag{2}$$

Note. — Eq. (1) may be found from the relation proved in Art. 100:

$$\frac{a-b}{a+b} = \frac{\tan\frac{1}{2}(\alpha-\beta)}{\tan\frac{1}{2}(\alpha+\beta)}, \text{ where } \frac{1}{2}(\alpha+\beta) = 45^{\circ}, \text{ and } \frac{1}{2}(\alpha-\beta) = \alpha-45^{\circ}.$$

EXAMPLES.

NOTE. — The angle between the line of sight and a horizontal plane is called an *angle of elevation* when the point sighted on is above the horizontal plane, and an *angle of depression* when it is below the horizontal plane.

- 1. The shadow of a vertical pole 30 feet high is 40 feet long. Find the elevation of the sun above the horizon.

 Ans. 36° 52'.2.
- 2. The vertical central pole of a circular tent is 20 feet high, and its top is fastened by ropes 40 feet long to stakes set in the ground, the ground being horizontal. How far are the stakes from the foot of the pole, and what is the inclination of the ropes to the ground?

 Ans. 34.641 feet; 30°.
- 3. The top of a lighthouse is 200 feet above the sea level, and the angle of depression to a buoy is 9° 52′.8. Find the horizontal distance of the buoy from the lighthouse.

 Ans. 1148.3 feet.
- 4. The horizontal distance from a point to the vertical wall of a tower is 1000 feet, and the angle of elevation of the top is 4° 15'.2. Find the height of the top of the wall above the point.

 Ans. 74.370 feet.
- 5. Two points A and B are on the opposite banks of a stream. A line AC at right angles to AB is measured 300 feet long, and the angle ACB is found by measurement to be 62° 30'.4. What is the distance from A to B?

Ans. 576.45 feet.

6. From the top of a lighthouse, 150 feet above the sea level, the angle of depression to a buoy was 12° 10'.2, and that to the shore, measured in the same vertical plane with the buoy, was 62° 14'.8. Find the distance in feet of the buoy from the shore.

Ans. Log. Tables, 616.60; Nat. Tables, 616.61.

- 7. The angle of elevation to the top of the vertical wall of a tower is 20° 10 .4, and the angle of depression to the hottom is 10° 11'.6, the horizontal distance from the observer to the wall being 250 feet. Find the height of the wall.

 Ans. 136.802 feet.
- 8. We wish to make a ladder that would reach from a point 20 feet in front of a building to the fourth story, a height of 45 feet. Find the length of the ladder and the angle it would make with the ground in this position.

Ans. 49.244 feet; 66° 2'.2.

- 9. The ridgepole of a roof is 15 feet above the center of the garret floor, and the garret is 40 feet wide. What is the inclination of the roof to a horizontal plane?

 Ans. 36° 52'.2.
- 10. A chord of a circle is 20 feet long, and the angle at the center subtended by it is 46° 43'.6. Find the radius of the circle.

 Ans. 25.217 feet.
- 11. The angle between two lines is 40° 12'.4, and a circle whose radius is 5730 feet is tangent to both lines. Find the distance from the point of tangency to the point of intersection of the two lines when the circle is in the smaller angle, and when it is in the larger angle formed by producing one of the lines.

Ans. 15655 and 2097.2 feet.

- 12. The legs of a pair of dividers are set so that the angle between them is 80° 24'.4. What is the distance between the points, the legs being 6 inches long?

 Ans. 7.7460 inches.
- 13. An equilateral triangle is circumscribed about a circle whose radius is 10 inches. Find the perimeter of the triangle. Ans. $60\sqrt{3}$ inches.
- 14. A wedge measures 12 inches along the side, and its base is 2 inches wide. Find the angle at its vertex.
 Ans. 9° 33'.6.
- 15. The side of a regular decagon is 2.4304 feet. Find the radii of the inscribed and circumscribed circles.

 Ans. 3.7400 feet; 3.9325 feet.
- 16. The area of a regular octagon is 24 square feet. Find the radius of the inscribed circle and the length of one of the sides. Ans. 2.6912 feet; 2.2295 feet,
- 17. The radius of the circumscribing circle of a regular dodecagon is 10 feet. Find the area of the dodecagon.

 Ans. 300.00 square feet.
- 18. A cord is stretched around two wheels with radii of 7 feet and 1 foot respectively, and with their centers 12 feet apart. Prove that the length of the cord is $12\sqrt{3} + 10\pi$ feet.
- 19. A cord is stretched around, and crossed between, two wheels whose radii are 5 feet and 1 foot respectively, their centers being 12 feet apart. Prove that the length of the cord is $12\sqrt{3} + 8\pi$ feet.
- 20. Find the radius and the length of an arc of 1° of the parallel of latitude at a place whose latitude is 42° 43′.9, the earth being regarded as a sphere whose radius is 3963.3 miles.

 Ans. 2911.1 miles; 50.809 miles.
- 21. The altitude of a right circular cone is 4.1436 feet, and the angle at its vertex is 20° 14'.2. Find its convex surface.

 Ans. 9.7780 square feet.

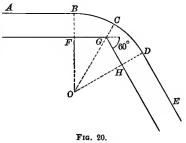

22. The altitude of a right pyramid with a square base is 14.453 feet, and the sides of the base are each 4.7036 feet. Find its slaut height, its lateral edge, and the angle between a face of the pyramid and its base.

Ans. 14.643 feet; 14.831 feet; 80° 45'.5.

- 23. The base of a trapezoid measured 600.430 feet, and the angles at the ends of the base were found to be 62° 14'.3 and 74° 18'.6. Find the length of the other base, the altitude being 40 feet. Ans. 568.138 feet.
- 24. Find the length of the perpendicular from the vertex of the right angle of a triangle to the hypotenuse, the hypotenuse being 6.4603 inches long, and one of the angles of the triangle being 40° 40'.4.

Ans. 3.1934 inches.

25. A street-railway track is 10 feet from the curbstone (FB = HD = 10), and in passing a corner where the

street is deflected through an angle of 60°, the rail must be 4 feet from the corner Ans. $OC = \frac{20 - 4\sqrt{3}}{2 - \sqrt{3}}$. (GC = 4). Find the radius of the circular curve.

26. Before paying for a pavement, it was necessary to find the area shaded Prove that it is $\frac{28750}{\sqrt{2}} + 7500$ square feet, the streets being in Fig. 21. 50 feet wide.

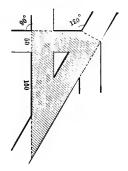

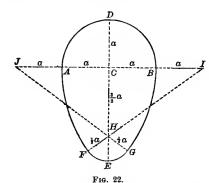

Fig. 21.

27. In the egg-shaped sewer (Fig. 22), C is the center of the arc ADB with a radius a; I and J, of AF and BG respectively with the radii 3a; and H, of FEG with the radius $\frac{1}{2}a$. Prove that its area is

$$a^{2}\left(\frac{\pi}{2} + \frac{1}{4}\tan^{-1}\frac{4}{3} + 9\tan^{-1}\frac{3}{4} - 3\right) = a^{2}\left(\frac{5}{8}\pi + \frac{35}{4}\tan^{-1}\frac{3}{4} - 3\right) = 4.59413 \ a^{2},$$

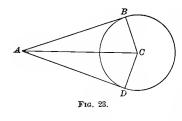

where $\tan^{-1}\frac{4}{3}$ is the angle whose tangent is $\frac{4}{3}$.

28. A hill rises 1 foot vertically in a horizontal distance of 30 feet. What is the difference of elevation of two points that are 1000 feet apart, the distance being measured on the ground?

$$\begin{aligned} \log \tan \alpha &= 8.52288 - 10 \\ \text{Cpl. } T' &= 3.53611 \\ \log \alpha' &= 2.05899 \\ \mathcal{S}' &= 6.46365 - 10 \\ \log \sin \alpha &= 8.52264 - 10 \\ \log 1000 &= 3. \end{aligned}$$
 log diff. of elev. = 1.52264 diff. of elev. = 33.315 feet.

29. The horizontal distance between the two extreme positions of the end of a pendulum 40 inches long is 4 inches. Through what angle does it swing?

Half-angle =
$$2^{\circ} 51'.96$$
. Ans. $5^{\circ} 43'.92$.

30. The angular diameter of the moon is 31'.12, and its distance is 238 840 miles. Find its diameter in miles.

$$BAD = 31'.12$$
, and $AC = 238840$.
Ans. 2162.0 miles.

31. The equatorial horizontal parallax of the sun is 8".8, and the radius of the earth is 3963.3 miles. Find the distance of the sun from the earth.

$$BAC = 8^{\prime\prime}.8$$
, and $BC = 3963.3$. Ans. 92 896 000 miles.

32. A circular chimney 100 feet high is 10 feet in diameter at the base, and 8 feet at the top. Find the angle at the vertex of the cone of which it is a frustum.

Half-angle =
$$34'.376$$
. Ans. $1^{\circ} 8'.752$.

Solve the following triangles, the first two elements being given:

33.
$$c = 0.02934$$
, $A = 31^{\circ} 14'.2$. $\therefore B = 58^{\circ} 45'.8$; $a = 0.015215$; $b = 0.025086$.

34. $c = 4.6136$, $B = 47^{\circ} 15'.6$. $\therefore A = 42^{\circ} 44'.4$; $a = 3.1311$; $b = 3.3885$.

35. $c = 436.53$, $A = 74^{\circ} 10'.6$. $\therefore B = 15^{\circ} 49'.4$; $a = 419.98$; $b = 119.03$.

36. $c = 0.96724$, $B = 40^{\circ} 40'.2$. $\therefore A = 49^{\circ} 19'.8$; $a = 0.73363$; $b = 0.63036$.

37.
$$c = 110.97$$
, $a = 67.291$. $\therefore A = 37^{\circ} 19'.8$; $B = 52^{\circ} 40'.2$; $b = 88.236$.

38.
$$c = 1843.7$$
, $b = 618.42$. . . $A = 70^{\circ} 24'.1$; $B = 19^{\circ} 35'.9$; $a = 1736.9$.

39.
$$c = 8226.5$$
. $a = 814.33$. . . $A = 81^{\circ} 50'.5$; $B = 8^{\circ} 9'.5$; $b = 116.74$.

40.
$$c = 0.03672$$
, $b = 0.01296$ $A = 69^{\circ} 19'.9$; $B = 20^{\circ} 40'.1$; $\alpha = 0.034357$.

41.
$$c = 4.8293$$
, $b = 0.31435$ $A = 86^{\circ} 16/.1$; $B = 3^{\circ} 43/.9$; $a = 4.8191$.

```
      42. a = 43.148, b = 84.107.
      \therefore A = 27^{\circ} 9'.5; B = 62^{\circ} 50'.5; c = 94.530.

      43. a = 759.28, b = 51.85.
      \therefore A = 86^{\circ} 5'.6; B = 3^{\circ} 54'.4; c = 761.05.

      44. a = 7642.5, b = 864.7.
      \therefore A = 83^{\circ} 32'.7; B = 6^{\circ} 27'.3; c = 7691.3.

      45. a = 0.04326, b = 0.54318.
      \therefore A = 4^{\circ} 33'.2; B = 85^{\circ} 26'.8; c = 0.54489.

      46. a = 903.64, A = 22^{\circ} 10'.3.
      \therefore B = 67^{\circ} 49'.7; b = 2217.4; c = 2394.5.

      47. b = 0.47922, A = 62^{\circ} 16'.4.
      \therefore B = 27^{\circ} 43'.6; a = 0.91176; c = 1.0300.

      48. a = 8.4642, B = 30^{\circ} 16'.4.
      \therefore A = 59^{\circ} 43'.6; b = 4.9409; c = 9.80075.
```

Solve the isosceles triangles (Fig. 16) in the following examples, the first two elements being given:

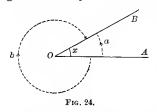

49. b = 18.436, $B = 65^{\circ} 15'.6$. $A = 24^{\circ} 44'.4$; a = 8.4954; c = 20.299.

```
a = 57^{\circ} 12'.05; \beta = 65^{\circ} 35'.9; p = 48.673.

```

CHAPTER III.

TRIGONOMETRIC FUNCTIONS OF ANY ANGLE.

30. Generation of Angles. — An angle may be considered as generated by a line revolving about a fixed point, the vertex;

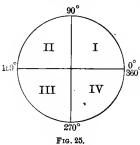

thus OA revolving about O in the direction a, to the position OB, describes the angle AOB. The side of the angle from which the revolution takes place is called the *initial* side, and that to which the describing line moves is called the terminal side.

The letters describing the initial side are written first in the symbol of the angle, so that the angle A OB is one in which the motion is from OA to OB.

31. Direction of Measurement. — The revolving line can move from OA to OB either in the direction marked a or in that marked b. The former motion, contrary to that of the hands of a watch, is arbitrarily considered positive and the latter negative. Thus if the angle x, between OA and OB, is 30° , the angle AOB is either $+30^{\circ}$ or -330° .

Any angle has two measures less than 360°, one positive and the other negative, their numerical sum being 360°.

32. Quadrants. — For convenience the measuring circle is divided into four parts called *quadrants*, as in the figure. An angle is in the first quadrant when its value lies between 0° and 90°; in the second, between 90° and 180°; in the third, between 180°

and 270° ; in the fourth, between 270° and 360° . Angles between 0° and -90° are in the fourth quadrant; between -90° and -180° , in the third; between -180° and -270° , in the second; between -270° and -360° , in the first.

Also, an angle between zero and $\frac{1}{2}\pi$ is in the first quadrant; between $\frac{1}{2}\pi$ and π , in the second; between π and $\frac{3}{2}\pi$, in the third; and between $\frac{3}{2}\pi$ and 2π , in the fourth.

33. Complement and Supplement. — Two angles are said to be complementary when their algebraic sum is 90°, as 60° and 30°, 120° and -30° , 260° and -170° ; and supplementary when their algebraic sum is 180°, as 120° and 60°, 230° and -50° , 300° and -120° .

Note. — In Fig. 2, $\frac{a}{h}$ is the sine of B; that is, it is the sine of the complement of A, and hence it is called the cosine of A.

Since $\frac{1}{2}\pi$ corresponds to 90°, and π to 180°, two angles are complementary when the algebraic sum of their circular measures is $\frac{1}{2}\pi$, and supplementary when it is π .

- 1. The complement of 200° is $90^{\circ} 200^{\circ} = -110^{\circ}$.
- 2. The complement of $90^{\circ} + x$ is $90^{\circ} (90^{\circ} + x) = -x$.
- 3. The supplement of 200° is $180^{\circ} 200^{\circ} = -20^{\circ}$.
- 4. The supplement of $270^{\circ} + x$ is $180^{\circ} (270^{\circ} + x) = -90^{\circ} x$.
- 5. The complement of $\frac{9}{10}\pi$ is $\frac{1}{2}\pi \frac{9}{10}\pi = -\frac{2}{5}\pi$.
- 6. The supplement of $\frac{5}{3}\pi$ is $\pi \frac{5}{3}\pi = -\frac{2}{3}\pi$.

Show that the complement of the first angle of each of the following pairs is equal to the second angle:

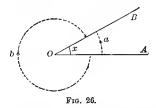

- 7. 145° and -55° ; 300° and -210° ; -70° and $+160^{\circ}$; -200° and $+290^{\circ}$.
- 8. $180^{\circ} x$ and $-90^{\circ} + x$; $270^{\circ} x$ and $-180^{\circ} + x$; $360^{\circ} x$ and $-270^{\circ} + x$.
 - 9. $\frac{1}{4}\pi$ and $\frac{1}{4}\pi$; $\frac{3}{2}\pi$ and $-\pi$; πx and $x \frac{1}{2}\pi$; $\frac{2}{3}\pi + x$ and $-\frac{1}{6}\pi x$.

Show that the supplement of the first angle of each of the following pairs is equal to the second angle :

- 10. 145° and 35°; 225° and -45°; -160° and 340°; -70° and 250°.
- 11. $270^{\circ} x$ and $-90^{\circ} + x$; $90^{\circ} + x$ and $90^{\circ} x$; $x 90^{\circ}$ and $270^{\circ} x$.
- 12. $\frac{1}{4}\pi$ and $\frac{3}{4}\pi$; $\frac{5}{3}\pi$ and $-\frac{2}{3}\pi$; $x-\pi$ and $2\pi-x$; $\frac{3}{2}\pi+x$ and $-\frac{1}{2}\pi-x$.
- 34. General Measure of an Angle.—The line OA may be brought into the position OB by revolving either through the small angle x, or through that angle and then through any

or

number of complete revolutions in either direction. The

general measure of the angle AOB is then not x, but $x+n360^{\circ}$, where n is any whole number, positive or negative.

The general circular measure of the angle whose circular measure less than 2π is x would be $x + 2n\pi$,

since 2π corresponds to a complete revolution.

- 1. Show that 1000° is in the fourth quadrant.*
- $1000^\circ=720^\circ+280^\circ=2\times360^\circ+280^\circ,$ two complete revolutions and 280° beyond; 280° lies in the fourth quadrant.
 - 2. Show that -3000° is in the third quadrant.
- $-3000^\circ=-2880^\circ-120^\circ=8(-360^\circ)-120^\circ$, eight complete revolutions and 120° beyond in the negative direction; -120° lies in the third quadrant.
 - 3. Show that $\frac{\pi}{2}(8n+\frac{3}{5})$ is in the first quadrant.
- $\frac{\pi}{2}(8n+\frac{3}{5})=2\tilde{n}\times 2\pi+\frac{3}{16}\pi$, 2n complete revolutions and $\frac{3}{10}\pi$ beyond; $\frac{3}{10}\pi$ is in the first quadrant.
- 4. Show that 1500° is in the first quadrant, 2690° in the second, 2720° in the third, 2100° in the fourth.
- 5. Show that -910° is in the second quadrant, -1100° in the fourth, -1400° in the first, -1920° in the third.
- 6. Show that $\frac{\pi}{5}(10n+6)$ is in the third quadrant, $\frac{\pi}{3}(12n+2)$ in the second, $\frac{\pi}{4}(8n+7)$ in the fourth, $\frac{2}{3}\pi(3n+2)$ in the third.
- 7. Show that $\frac{4}{5}\pi(10 n \frac{1}{2})$ is in the fourth quadrant, $\frac{4}{5}\pi(15 n \frac{2}{3})$ in the third, $\frac{4}{3}\pi(-9 n \frac{2}{3})$ in the third, $\frac{1}{5}\pi(10 n 9)$ in the first.
- 8. Show that $\frac{\pi}{3}(9n+1)$ will lie in the third or in the first quadrant, according as n is odd or even.
 - 9. Show that the general circular measure of 0° is $2 n\pi$, and not $n\pi$.
- 10. Show that the general circular measure of 90° is $(2n + \frac{1}{2})\pi$; of 180°, $(2n + 1)\pi$; of 270°, $(2n + \frac{3}{8})\pi$.
- 11. If $x = 60^{\circ}$, show that one third of the general measure of x will be 20°, 140°, and 260°, the terminal side of the angle for all values of $\frac{1}{3}x$ greater than 260° falling in one of these positions.

We have, using the general measure, $x + n 360^{\circ}$,

$$x=60^{\circ},\ 420^{\circ},\ 780^{\circ},\ 1140^{\circ},\ 1500^{\circ},\ 1860^{\circ},\cdots$$

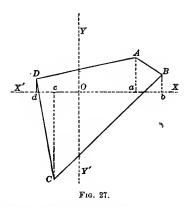

. $\frac{1}{3}x=20^{\circ},\ 140^{\circ},\ 260^{\circ},\ 380^{\circ},\ 500^{\circ},\ 620^{\circ},\cdots$
 $\frac{1}{3}x=20^{\circ},\ 140^{\circ},\ 260^{\circ},\ 20^{\circ},\ 140^{\circ},\ 260^{\circ},\cdots$

if we reduce the values of $\frac{1}{3}x$ that are greater than 360° to others less than 360° by subtracting some multiple of 360°.

* That is, show that when the angle is 1000° the terminal side will lie in the fourth quadrant.

- 12. If $x = 45^{\circ}$, show that $\frac{1}{3}x$ will be 15°, 135°, 255°, three values.
- 13. If $x = 20^{\circ}$, show that $\frac{1}{4}x$ will be 5°, 95°, 185°, 275°, four values.
- 14. If $x = 60^{\circ}$, show that $\frac{1}{6}x$ will be 10°, 70°, 130°, 190°, 250°, 310°, six values.
- 15. If $x = m^{\circ}$, show that $\frac{1}{n}x$ will have n values less than 360°, as $\frac{m^{\circ}}{n}$, $\frac{m^{\circ}}{n} + \frac{360^{\circ}}{n}$, $\frac{m^{\circ}}{n} + \frac{720^{\circ}}{n}$,... to $\frac{m^{\circ}}{n} + \frac{(n-1)360^{\circ}}{n}$.
- 35. The definitions of the trigonometric ratios in Art. 8 are applicable only to angles less than 90°. We shall now consider the more general definitions, of which those in Art. 8 are special cases.
- 36. Map Drawing by Coördinates.* Let ABCD be a field whose map is wanted. From any point O in the field, measure the distances Oa, Ob, Oc, and Od, and also measure the distances aA, bB, cC, and dD, at right angles to X'OX. Lay off

on the paper a line X'X of indefinite length, and take on it some point O to represent the point O in the field. Lay off Oa according to some convenient scale; thus if Oa were 200 feet, and the scale were 20 feet to 1 inch, we would on the map make Oa 10 inches long. Then draw the line aA perpendicular to OX on the proper side of OX, and lay off on it the distance corresponding to

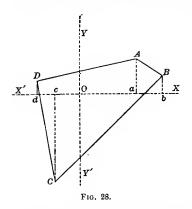

aA according to the same scale, thus locating the point A. The other points would be located in a similar manner.

Since Oa and Oc are measured from O in contrary directions, and aA and cC are measured on opposite sides of X'X, there is danger of laying them off in the wrong direction; hence their directions must be carefully distinguished.

37. Coordinates. — The distance Oa, measured along X'OX, is called the *abscissa* of the point A; aA, measured parallel to

^{*} This is called the method of offsets. crock. Trig. — 3

Y'OY, the ordinate of A; and the two distances Oa and aA, the coördinates of A. The line X'OX is called the axis of abscissas; the line Y'OY, the axis of ordinates; and the point

O, the origin of coördinates.

The abscissa of a point is its distance from the axis of ordinates measured on a line parallel to the axis of abscissas.

The *ordinate* of a point is its distance from the axis of abscissas measured on a line parallel to the axis of ordinates.

The abscissa is positive when the point is on the right of the axis of ordinates, and negative when it is on the left; the ordi-

nate is positive when the point is above the axis of abscissas, and negative when it is below. If we consider the abscissas as measured from Y'OY, and the ordinates from X'OX, they will be positive when measured to the right and upward respectively.

Using the customary notation for directed lines,* Oc will represent a line measured from O to c, and cO will be measured from c to c. The line cO measured to the right is positive, and c to the left is negative. Hence the coördinates of c are c and c and c and c and c are c and c are written in a parenthesis with a comma between them, the abscissa being written first; thus the point c is called the point c and c and c are c and c are c are c and c are c and c are c are c are c and c are c are c and c are c and c are c are c and c are c are c and c are c are c are c and c are c are c and c are c and c are c are c are c and c are c and c are c and c are c are c are c are c and c are c are c and c are c are c and c are c and c are c are c are c and c are c are c and c are c are c and c are c and c are c are c and c are c

The ordinate of any point on X'OX is zero, the abscissa of any point on Y'OY is zero, and both coördinates of the origin are zero.

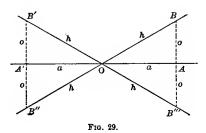

The signs of the numerical coördinates of points in the different quadrants are as follows:

Quadrant	;	٠	٠	•	I.	II.	III.	IV.
Abscissa					+	_	_	+
Ordinate					+	+		_

38. Distance of a Point from the Origin. — Represent the abscissa of the point by a, its ordinate by o, and its distance from the origin by h. Then

$$h = \sqrt{a^2 + o^2},$$

since h is the hypotenuse of a right triangle whose sides are a and o. Although h may be either positive or negative, it will be sufficient for our purposes to treat it as being always positive.

39. Trigonometric Ratios. — Take the origin of coördinates at the vertex of the angle and the initial side as the axis of abscissas. From any point B on the terminal side of the angle, draw AB perpendicular to the initial side; denote the abscissa OA of the point by a, its ordinate AB by o, and its distance OB from the origin by h. The general definitions of the trigonometric ratios are:

The sine of the angle
$$=\frac{\text{ordinate}}{\text{distance}} = \frac{o}{h}$$

The cosine of the angle $=\frac{\text{abscissa}}{\text{distance}} = \frac{a}{h}$

The tangent of the angle $=\frac{\text{ordinate}}{\text{abscissa}} = \frac{o}{a}$

The cotangent of the angle $=\frac{\text{abscissa}}{\text{ordinate}} = \frac{a}{o}$

The secant of the angle $=\frac{\text{distance}}{\text{abscissa}} = \frac{h}{a}$

The cosecant of the angle $=\frac{\text{distance}}{\text{ordinate}} = \frac{h}{o}$

Note. — The origin is always at the vertex of the angle; the axis of abscissas always coincides with the initial side; and the positive direction of the axis of ordinates is along the line that makes an angle of $+90^{\circ}$ with the initial side.

Prove that the following equations are true, using Eqs. (1):

1.
$$\frac{\sec x}{\sqrt{\sec^2 x - 1}} = \csc x.$$

$$\sec x = \frac{h}{a};$$

$$\therefore \frac{\sec x}{\sqrt{\sec^2 x - 1}} = \frac{\frac{h}{a}}{\sqrt{\frac{h^2}{a^2} - 1}} = \frac{h}{\sqrt{h^2 - a^2}} = \frac{h}{o} = \csc x.$$

2.
$$\sec x \cos x = 1$$
.

7.
$$\tan x \cot x = 1$$
.

3.
$$\csc x \sin x = 1$$
.

8.
$$\sin^2 x + \cos^2 x = 1$$
.

4.
$$\csc^2 x = 1 + \cot^2 x$$
.

9.
$$\sec^2 x = 1 + \tan^2 x$$
.

$$5. \frac{\tan x}{\sqrt{1+\tan^2 x}} = \sin x.$$

$$10. \ \frac{\sqrt{1+\cot^2 x}}{\cot x} = \sec x.$$

$$6. \ \frac{\sqrt{\csc^2 x - 1}}{\csc x} = \cos x.$$

11.
$$\sqrt{\frac{1+\cot^2 x}{\csc^2 x-1}}=\sec x.$$

12.
$$(\tan x - \cot x)(\tan x + \cot x) = \frac{h^2(o^2 - a^2)}{o^2a^2} = \sec^2 x - \csc^2 x$$
.

13. $(\tan x + \cot x) \sin x \cos x = 1$.

Construct geometrically the angles, and compute the corresponding ratios in the following examples: *

Quadrant. Sin. Cos. Tan. Cot. Sec. Cosec. 14.
$$\sin x = +\frac{3}{5}$$
. I. $+\frac{4}{5}$. $+\frac{3}{4}$. $+\frac{3}{4}$. $+\frac{4}{5}$. $+\frac{5}{4}$. $+\frac{5}{3}$. 11. $-\frac{4}{5}$. $-\frac{3}{4}$. $-\frac{4}{5}$. $-\frac{5}{4}$. $-\frac{5}{4}$. $+\frac{5}{3}$. 15. $\sin x = -\frac{1}{3}$. 40. Trigonometric Functions. — One quantity is said to be a function of another when it depends upon the latter for its value. Thus, if $y = \sin x$, y is a function of x, since it depends upon x for its value, any change in the value of x producing a change in the value of y.

The trigonometric functions are the sine, cosine, tangent, cotangent, secant, cosecant, versed sine, coversed sine, and suversed sine. The last three are defined by the equations:

The versed sine is
$$\operatorname{vers} x = 1 - \cos x$$
.
The coversed sine is $\operatorname{covers} x = 1 - \sin x$.
The suversed sine is $\operatorname{suvers} x = 1 + \cos x$.

41. Geometrical Representation of the Functions.—In Fig. 30 let the radius OB, of the circle described about the vertex O of the angle AOB as a center, be unity, and let the angle AOY be equal to 90° . NM and FD are tangent to the circle at X and Y respectively; the triangles OAB, OXM, and OYD, are right-angled; and the angle YDO is equal to the given angle AOB. Then the trigonometric functions of the angle AOB are represented by the lines shown in the figure. For, in Figs. 2 and 29, B is any point on the terminal side OB of the angle AOB, and therefore we may choose the position of B so that OB, or h, shall be equal to unity. Comparing Fig. 30 with Figs. 2 and 29, and using the definitions in Arts. 8, 39, and 40, we see that

$$\sin AOB = \frac{o}{h} = \frac{AB}{OB} = AB.$$

$$\cos AOB = \frac{a}{h} = \frac{OA}{OB} = OA.$$

$$\tan AOB = \frac{o}{a} = \frac{AB}{OA} = \frac{XM}{OX} = XM.$$

$$\cot AOB = \frac{a}{o} = \frac{OA}{AB} = \frac{CB}{OC} = \frac{YD}{OY} = YD.$$

$$\sec AOB = \frac{h}{a} = \frac{OB}{OA} = \frac{OM}{OX} = OM.$$

$$\csc AOB = \frac{h}{o} = \frac{OB}{AB} = \frac{OB}{OC} = \frac{OD}{OY} = OD.$$

$$\cot AOB = \frac{h}{OA} = \frac{OB}{OA} = \frac{OA}{OA} = \frac{OA}{OA} = AX.$$

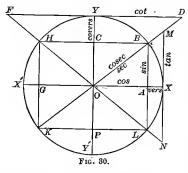

$$\cot AOB = \frac{h}{OA} = \frac{OB}{OA} = \frac{OA}{OA} = OA = AX.$$

$$\cot AOB = 1 - \cos AOB = OX - OA = AX.$$

$$\cot AOB = 1 - \sin AOB = OY - OC = CY.$$

$$\cot AOB = 1 + \cos AOB = X'O + OA = X'A.$$

The trigonometric functions are ratios,—pure numbers,—and are represented by these lines in the circle whose-radius is

unity; that is, they are actually equal to the ratios of these lines to the radius.

If, with a radius of unity and the vertex of the angle as the center, a circle be described and two tangents be drawn, one where the initial side OA cuts the circle, and the other at a distance of $+90^{\circ}$ from this point (at X and Y respec-

tively), the trigonometric functions will be represented as follows:

The sine of an angle will be the perpendicular distance from the point where the terminal side of the angle cuts the circle, to the initial side, produced if necessary; positive when it is above, and negative when below, the initial side. Thus $\sin A OB = AB$, $\sin A OH = GH$, $\sin A OK = GK$, $\sin A OL = AL$. AB and GH, above X'OX, are positive, while GK and AL are negative, being below X'OX. The sine is therefore positive when

the angle is in the first or second quadrant, and negative when it is in the third or fourth.

The cosine will be the distance from the center to the foot * of the sine; positive when measured to the right, and negative to the left, of the center. Thus $\cos AOB = OA$, $\cos AOH = OG$, $\cos AOK = OG$, $\cos AOL = OA$. OA, measured to the right of the center, is positive, while OG, measured to the left, is negative. The cosine is therefore positive when the angle is in the first or fourth quadrant, and negative when it is in the second or third.

The tangent will be the distance along the line tangent to the circle at the point where the initial side cuts the circle, from this point to the point where this tangent is cut by the terminal side of the angle, produced if necessary; positive when measured above, and negative when below, the initial side. Thus $\tan AOB = XM$, $\tan AOH = XN$, $\tan AOK = XM$, $\tan AOL = XN$. XM, above X'OX, is positive, and XN, below X'OX, is negative. Therefore the tangent is positive when the angle is in the first or third quadrant, and negative when it is in the second or fourth.

The cotangent will be the distance along the second tangent (FYD) from the point of tangency to the point where this line is cut by the terminal side of the angle, produced if necessary; positive when measured to the right, and negative to the left, of the point of tangency. Thus $\cot AOB = YD$, $\cot AOH = YF$, $\cot AOK = YD$, $\cot AOL = YF$. YD, measured to the right, is positive, and YF, measured to the left, is negative. Therefore the cotangent is positive when the angle is in the first or third quadrant, and negative when it is in the second or fourth.

Note. — The positive directions of measurement are above X'OX and to the right of Y'OY, and the negative are below X'OX and to the left of Y'OY.

The secant will be the distance from the center along the terminal side of the angle, produced if necessary, to its point of intersection with the tangent at the point of intersection of the initial side with the circle; positive when measured along the side itself, and negative when along the side produced. Thus $\sec AOB = OM$, $\sec AOH = ON$, $\sec AOK = OM$, $\sec AOL = ON$.

^{*} The foot of the sine is the point where the perpendicular line representing the sine cuts the initial side, produced if necessary.

Since $\sec AOB$ and $\sec AOL$ are measured along the terminal side itself, they are positive. The terminal sides (OH) and OK of the angles AOH and AOK must be produced in order that they may intersect the tangent line NM, and therefore $\sec AOH$ and $\sec AOK$ are negative. Hence the secant is positive when the angle is in the first or fourth quadrant, and negative when it is in the second or third.

The cosecant will be the distance from the center along the terminal side, produced if necessary, to its intersection with the second tangent, FYD; positive when measured along the side itself, and negative when along the side produced. Thus cosec AOB = OD, cosec AOH = OF, cosec AOK = OD, cosec AOH = OF, cosec AOH are measured along the terminal side itself, they are positive, while cosec AOK and cosec AOL, measured along the side produced, are negative. Therefore the cosecant is positive when the angle is in the first or second quadrant, and negative when it is in the third or fourth.

The versed sine $(1 - \cos x)$ will be the distance from the foot of the sine to the point where the initial side cuts the circle; always positive, because $-\cos x$ can never be greater than the radius, or unity. Thus vers AOB = AX, vers AOH = GX, vers AOK = GX, vers AOL = AX.

The coversed sine $(1 - \sin x)$ will be the distance from the point C or P, where a line drawn through the point of intersection of the terminal side and the circle parallel to the initial side cuts Y'OY, to the point Y; always positive, since $\sin x$ can never be greater than the radius, or unity. Thus covers AOB = CY, covers AOH = CY, covers AOK = PY, covers AOL = PY.

The suversed sine $(1 + \cos x)$ will be the distance from the point X', where the initial side produced cuts the circle, to the foot of the sine; always positive, since $\cos x$ can never be algebraically less than minus unity. Thus suvers AOB = X'A, suvers AOH = X'G, suvers AOK = X'G, suvers AOL = X'A.

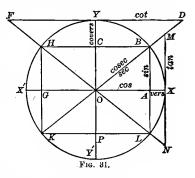

Note. — These lines represent the trigonometric functions, only when the radius of the circle is unity. If the radius differs from unity, the functions are equal to the lengths of these lines divided by the radius.

42. Changes in the Values of the Functions. — Let OX be the initial side of the angle, and let the terminal side first

coincide with OX, and then, in revolving about O, come into the positions OM, OY, OH, OX', OK, OY', ON, and OX, and let us consider the resulting changes in the values of the sine and of the tangent.

The sine of 0° , the terminal side coinciding with OX, is

zero. As the angle increases, the sine, being positive, also increases ($\sin AOB = AB$), until at 90° it is equal to the radius, or $+1(\sin AOY = OY)$. The sine then decreases ($\sin AOH = GH$), still being positive; and at 180° it is zero, the terminal side coinciding with OX'. The sine then becomes negative, and decreases algebraically, in-

creasing numerically ($\sin AOK = GK$), until at 270° it is equal to the radius, or -1 ($\sin AOY' = OY'$). It then increases algebraically, decreasing numerically ($\sin AOL = AL$); and at 360° it again becomes zero.

The tangent of 0° is zero; the tangent then becomes positive, and at 90° it is infinite, the terminal side being parallel to XM; then negative, and at 180° it is zero; then positive, and at 270° it is infinite; then negative, and at 360° it is zero. Just before the terminal side reaches the position OY, the tangent is positive, and just after, it is negative; therefore the tangent of 90° is $\pm \infty$, the upper sign being that of the function of an angle a little less than 90°.

The table gives the values of the functions of 0°, 90°, 180°, 270°, and 360°, and their signs in quadrants I., II., III., and IV.:

	0°.	I.	90°.	II.	180°.	III.	270°.	IV.	360°.
sin.	0 + 1	+.	+ 1	+	0, -1	_	- 1 0	 +	0 + 1
tan.	0	+	œ		0	+	οc	_	0
cot.	œ	+	0	_	œ	+	0	_	∞
sec.	+ 1	+	ο¢	_	- 1	_	∞	+	+1
cosec.	œ	+	+ 1	+	∞	_	- 1	-	∞

43. Limiting Values of the Functions. — The sine and cosine may have any value between +1 and -1, but they cannot have a value numerically greater than unity.

The tangent and cotangent may have any value between $+\infty$ and $-\infty$; that is, no matter what a number may be, there will always be some angle that will have that number as the value of its tangent, and another having it as its cotangent.

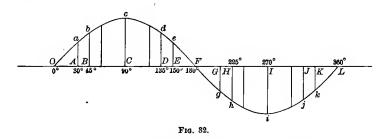

The secant and cosecant may have any value between +1 and $+\infty$, or -1 and $-\infty$; but they cannot have a value numerically less than unity.

The versed sine, coversed sine, and suversed sine may have any value between zero and +2.

Note. —In the first quadrant, all the functions are positive, and the sine, tangent, and secant increase as the angle increases; while the cosine, cotangent, and cosecant decrease as the angle increases.

Note. — The functions change signs only when they pass through the values zero and infinity.

44. Graphical Representation of the Functions.—Let the distance OL represent 360°, so that 1° is represented by $\frac{1}{360}OL$. At C, such that $OC = \frac{1}{4}OL$, draw a line perpendicular to OL, and

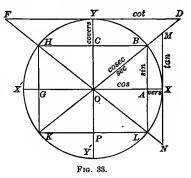

lay off on it any convenient distance Cc, to represent the sine of 90°, above the line OL, since $\sin 90^\circ = +1$. At A, such that $OA = \frac{1}{12}OL$, lay off $Aa = \frac{1}{2}Cc$, since $\sin 30^\circ = +\frac{1}{2}$; at B, such that $OB = \frac{1}{8}OL$, lay off $Bb = Cc\sqrt{\frac{1}{2}}$, since $\sin 45^\circ = +\sqrt{\frac{1}{2}}$; at H, such that $OH = \frac{5}{8}OL$, lay off $Hh = Cc\sqrt{\frac{1}{2}}$, below OL, since $\sin 225^\circ = -\sqrt{\frac{1}{2}}$; and so on, locating as many points a, b, c, h, etc., as may be necessary. Draw a smooth curve through O, a, b, c, d, e, F, h, i, j, L, and we have the sinusoid, in which the

abscissas correspond to the angles, and the ordinates to their sines.

We might have taken OL equal to the circumference of the circle whose radius is unity, and Cc equal to this radius. The scale would then have been the same for both the ordinates and the abscissas.

The graphical representations of the other functions may be constructed in a similar manner.

45. Two Angles correspond to Any Given Function. — In Fig. 33 let the arcs YB, YH, Y'K, and Y'L be equal; therefore the arcs XB, X'H, X'K, and XL are equal. Hence

$$AB = GH = OC$$
; $AL = GK = OP$; $OM = ON$; $OD = OF$.

OC is not equal to OP since they have contrary signs, OC being positive and OP negative on account of their directions.

$$AB = \sin XOB$$
; $GH = \sin XOH$;

$$\therefore \sin XOB = \sin XOH.$$

$$GK = \sin XOK$$
; $AL = \sin XOL$;

$$\therefore \sin XOK = \sin XOL.$$

Therefore two angles that differ by equal amounts from 90°, or from 270°, will have the same sine; thus $\sin (90^{\circ} + 2^{\circ}) = \sin (90^{\circ} - 2^{\circ})$, and $\sin (270^{\circ} + 3^{\circ}) = \sin (270^{\circ} - 3^{\circ})$.

Note. — The two angles corresponding to a given function may be *identical*; thus, if $\sin x = +1$, the only value of x is 90° , or $90^{\circ} - 0^{\circ}$ and $90^{\circ} + 0^{\circ}$.

Again
$$OA = \cos XOB = \cos XOL$$
;
and $OG = \cos XOH = \cos XOK$.

Therefore two angles differing by equal amounts from 0° , from 180° , or from 360° , will have the same cosine; thus $\cos(-5^{\circ}) = \cos 5^{\circ}$, $\cos(180^{\circ}+5^{\circ}) = \cos(180^{\circ}-5^{\circ})$, and $\cos(360^{\circ}-10^{\circ}) = \cos 10^{\circ}$.

Also
$$XM = \tan XOB = \tan XOK$$
;
and $XN = \tan XOH = \tan XOL$.

Therefore two angles differing from each other by 180° will have the same tangent; thus $\tan 140^{\circ} = \tan 320^{\circ}$.

Again
$$YD = \cot XOB = \cot XOK$$
;
and $YF = \cot XOH = \cot XOL$.

Therefore two angles differing from each other by 180° will have the same cotangent; thus cot $200^{\circ} = \cot 20^{\circ}$.

Also
$$+ OM = \sec XOB$$
; $+ ON = \sec XOL$;
 $\therefore \sec XOB = \sec XOL$.
 $- OM = \sec XOK$; $- ON = \sec XOH$;
 $\therefore \sec XOK = \sec XOH$.

Therefore two angles differing by equal amounts from 0° , from 180° , or from 360° , will have the same secant; thus $\sec(-5^{\circ}) = \sec 5^{\circ}$, $\sec(180^{\circ} - 3^{\circ}) = \sec(180^{\circ} + 3^{\circ})$, and $\sec(360^{\circ} - 5^{\circ}) = \sec 5^{\circ}$.

Again
$$+OD = \operatorname{cosec} XOB$$
; $+OF = \operatorname{cosec} XOH$;
 $\cdot \cdot \cdot \operatorname{cosec} XOB = \operatorname{cosec} XOH$.
 $-OD = \operatorname{cosec} XOK$; $-OF = \operatorname{cosec} XOL$;
 $\cdot \cdot \cdot \operatorname{cosec} XOK = \operatorname{cosec} XOL$.

Therefore two angles differing by equal amounts from 90°, or from 270°, will have the same cosecant; thus cosec $(90^{\circ} + 10^{\circ}) = \csc(90^{\circ} - 10^{\circ})$, and cosec $(270^{\circ} - 60^{\circ}) = \csc(270^{\circ} + 60^{\circ})$.

The four angles XOB, XOH, XOK, and XOL, have the same functions numerically. Thus if $\sin x = \pm \frac{1}{2}$, x will be 30°, 150°, 210°, and 330°; the first two corresponding to the value $+\frac{1}{2}$, and the last two to $-\frac{1}{2}$.

EXAMPLES.

1.	What angle has the same sine as 140°?	Ans.	40°.
2.	What angle has the same sine as 220°?	Ans.	320° .
3.	What angle has the same cosine as 330°?	Ans.	30°.
4.	What angle has the same cosine as 220°?	Ans.	140°.
5.	What angle has the same tangent as 230°?	Ans.	50°.
6.	What angle has the same tangent as 300°?	Ans.	120°.
7.	What angle has the same cotangent as 240°?	Ans.	60°.
8.	What angle has the same cotangent as 110°?	Ans.	290°.
9.	What angle has the same secant as 315°?	Ans.	45°.
10.	What angle has the same secant as 160°?	Ans.	200°.
11.	What angle has the same cosecant as 110°?	Ans.	70°.
12 .	What angle has the same cosecant as 300°?	Ans.	240°.

Find the values of θ less than 360° in Exs. (13-24):*

- 13. $\sin \theta = -\sin 200^{\circ}$. Ans. 20°. 19. $\cot \theta = -\cot 105^{\circ}$. Ans. 75°.
- 14. $\sin \theta = -\sin 100^{\circ}$. Ans. 260°. 20. $\cot \theta = -\cot 205^{\circ}$. Ans. 155°.
- 15. $\cos \theta = -\cos 150^{\circ}$. Ans. 30°. 21. $\sec \theta = -\sec 140^{\circ}$. Ans. 40°.
- 16. $\cos \theta = -\cos 300^{\circ}$. Ans. 120°. 22. $\sec \theta = -\sec 325^{\circ}$. Ans. 145°.
- 17. $\tan \theta = -\tan 350^{\circ}$. Ans. 10° . 23. $\csc \theta = -\csc 120^{\circ}$. Ans. 240° .
- **18.** $\tan \theta = -\tan 230^{\circ}$. Ans. 130°. **24.** $\csc \theta = -\csc 355^{\circ}$ Ans. 5°.
 - 25. $\cos 3\theta = +\frac{1}{2}\sqrt{3}$. Find three values of θ less than 180°.
 - $3\,\theta$ may be $30^{\circ},$ or $330^{\circ},$ or these values plus any number of circumferences;

...
$$3 \theta = 30^{\circ}, 390^{\circ}, 750^{\circ}, \dots, 330^{\circ}, 690^{\circ}, 1050^{\circ}, \dots$$

... $\theta = 10^{\circ}, 130^{\circ}, 250^{\circ}, \dots, 110^{\circ}, 230^{\circ}, 350^{\circ}, \dots$

= 10, 130, 250, ..., 110, 250, 550, ... Ans. $\theta = 10^{\circ}$, 110°, 130°.

26. $\sin 2\theta = -\frac{1}{2}$. Find four values of θ less than 360°.

Ans. 105°, 285°, 165°, 345°.

27. $\tan 3 \theta = -1$. Find six values of θ less than 360°.

Ans. 45°, 165°, 285°, 105°, 225°, 345°.

28. $\sec 5 \theta = -2$. Find five values of θ less than 180°.

Ans. 24°, 96°, 168°, 48°, 120°.

29. $\cot 5\theta = +1$. Find five values of θ less than 180° .

Ans. 9°, 81°, 153°, 45°, 117°.

30. $\cos 4\theta = -\frac{1}{2}$. Find four values of θ less than 180°.

Ans. 30°, 120°, 60°, 150°.

- 31. $\sin\theta = \frac{1}{2}$. Show that the general measure of θ is $(2 n + \frac{1}{2}) \pi \pm \frac{1}{3} \pi$. $\theta = 30^{\circ}$ and 150° , or $90^{\circ} 60^{\circ}$ and $90^{\circ} + 60^{\circ}$, or $90^{\circ} \pm 60^{\circ}$, or $\frac{1}{2} \pi \pm \frac{1}{3} \pi$. But the general measures of θ are these values increased by any number (n) of circumferences. $\theta = 2 n\pi + \frac{1}{2} \pi \pm \frac{1}{3} \pi = (2n + \frac{1}{2}) \pi \pm \frac{1}{3} \pi$.
- 32. $\sin \theta = +\frac{1}{2}\sqrt{2}$, $\tan \theta = -1$; the general measure of θ is $2n\pi + \frac{3}{4}\pi$. Note that θ is in the second quadrant, since its sine is positive and its tangent is negative.
- 33. $\cos \theta = -\frac{1}{3}$, $\csc \theta = +\frac{3}{2\sqrt{2}}$; the general measure of θ is $2n\pi + \theta'$, where θ' is the value of θ that lies between $\frac{1}{2}\pi$ and π .
 - 34. $\cos \theta = -\frac{1}{2}$; the general measure of θ is $(2n+1)\pi \pm \frac{1}{3}\pi$.
- 35. $\sin 2\theta = +\frac{1}{2}$; the general measures of θ are $(2n+\frac{1}{4})\pi \pm \frac{1}{6}\pi$, and $(2n+\frac{5}{2})\pi \pm \frac{1}{6}\pi$.
- 36. $\cos 3\theta = -\frac{1}{2}$; the general measures of θ are $(2n + \frac{1}{3})\pi \pm \frac{1}{9}\pi$, $(2n + 1)\pi \pm \frac{1}{9}\pi$, and $(2n + \frac{5}{9})\pi \pm \frac{1}{9}\pi$.

Construct geometrically (Art. 11) the two angles when

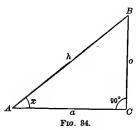

- 37. $\sin x = +\frac{1}{3}$. 41. $\tan x = +2$. 45. $\sec x = +3$.
- 38. $\sin x = -\frac{1}{4}$. 42. $\tan x = -\frac{1}{2}$. 46. $\sec x = -\frac{5}{4}$.
- 39. $\cos x = +\frac{2}{5}$. 43. $\cot x = +\frac{2}{3}$. 47. $\csc x = +6$.
- **40.** $\cos x = -\frac{2}{3}$. **44.** $\cot x = -\frac{2}{3}$. **48.** $\csc x = -\frac{4}{3}$.

^{*} Only one of the two answers is given.

CHAPTER IV.

RELATIONS BETWEEN THE FUNCTIONS OF ONE ANGLE.

46. Relations between the Functions of One Angle.

$$o^{2} + a^{2} = h^{2}; \quad \therefore \frac{o^{2}}{h^{2}} + \frac{a^{2}}{h^{2}} = 1;$$

$$\therefore \sin^{2} x + \cos^{2} x = 1. \tag{1}$$

$$\tan x = \frac{o}{a} = \frac{\frac{o}{h}}{a} = \frac{\sin x}{\cos x};$$

$$\therefore \tan x = \frac{\sin x}{\cos x};$$

$$\cot x = \frac{a}{a} = \frac{1}{\tan x};$$
(2)

$$\cot x = \frac{\cos x}{\sin x}.$$
 (4)

$$h^2 = a^2 + o^2; \quad \therefore \frac{h^2}{a^2} = 1 + \frac{o^2}{a^2};$$

$$\therefore \sec^2 x = 1 + \tan^2 x. \tag{5}$$

$$h^2 = o^2 + a^2; \quad \therefore \quad \frac{h^2}{o^2} = 1 + \frac{a^2}{o^2};$$

$$\cdots \operatorname{cosec}^2 x = 1 + \cot^2 x. \tag{6}$$

$$\sec x = \frac{h}{a} = \frac{1}{\cos x}. (7)$$

$$\sec x = \frac{h}{o} = \frac{1}{\sin x}.$$
 (8)

$$\operatorname{vers} x = 1 - \cos x. \tag{9}$$

covers
$$x = 1 - \sin x$$
. (10)

suvers
$$x = 1 + \cos x$$
. (11)

Note. — These formulas may be easily remembered by the use of Fig. 30, where

$$AB^2 + OA^2 = OB^2$$
, or $\sin^2 x + \cos^2 x = 1$.
 $\tan x = \frac{XM}{OX} = \frac{AB}{OA}$, or $\tan x = \frac{\sin x}{\cos x}$.
 $\cot x = \frac{YD}{OY} = \frac{CB}{OC}$, or $\cot x = \frac{\cos x}{\sin x}$.
 $OM^2 = OX^2 + XM^2$, or $\sec^2 x = 1 + \tan^2 x$.
 $OD^2 = OY^2 + YD^2$, or $\csc^2 x = 1 + \cot^2 x$.

47. To express One Function in Terms of Each of the Others.—Suppose that we wish to find expressions for $\sin x$ that shall contain only $\cos x$, $\tan x$, $\cot x$, $\sec x$, and $\csc x$ respectively. From the preceding article we have:

$$\sin^2 x + \cos^2 x = 1$$
, and $\csc x = \frac{1}{\sin x}$;
 $\therefore \sin x = \pm \sqrt{1 - \cos^2 x}$
 $\sin x = \frac{1}{\csc x}$

and

The other expressions are derived from these as follows:

$$\sin x = \frac{1}{\csc x} = \pm \frac{1}{\sqrt{1 + \cot^2 x}}, \text{ from (6).}$$

$$\therefore \sin x = \pm \frac{1}{\sqrt{1 + \cot^2 x}} = \pm \frac{1}{\sqrt{1 + \frac{1}{\tan^2 x}}} = \pm \frac{\tan x}{\sqrt{1 + \tan^2 x}}, \text{ from (3).}$$

$$\therefore \sin x = \pm \frac{\tan x}{\sqrt{1 + \tan^2 x}} = \pm \frac{\sqrt{\sec^2 x - 1}}{\sec x}, \text{ from (5).}$$

The double signs are due to the fact that there are two angles corresponding to any given function; thus if $\cos x = \frac{1}{2}$, the angle might be either in the first or in the fourth quadrant, and the sine would be positive in the first case and negative in the second. It will be seen that if any one of the functions is given, all the others found from it will have the double sign, except its reciprocal.

In the same way it may be shown that*

$$\cos x = \sqrt{1 - \sin^2 x} = \frac{1}{\sqrt{1 + \tan^2 x}} = \frac{\cot x}{\sqrt{1 + \cot^2 x}} = \frac{1}{\sec x} = \frac{\sqrt{\csc^2 x - 1}}{\csc x}.$$

$$\tan x = \frac{\sin x}{\sqrt{1 - \sin^2 x}} = \frac{\sqrt{1 - \cos^2 x}}{\cos x} = \frac{1}{\cot x} = \sqrt{\sec^2 x - 1} = \frac{1}{\sqrt{\csc^2 x - 1}}.$$

$$\cot x = \frac{\sqrt{1 - \sin^2 x}}{\sin x} = \frac{\cos x}{\sqrt{1 - \cos^2 x}} = \frac{1}{\tan x} = \frac{1}{\sqrt{\sec^2 x - 1}} = \sqrt{\csc^2 x - 1}.$$

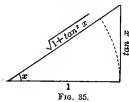

$$\sec x = \frac{1}{\sqrt{1 - \sin^2 x}} = \frac{1}{\cos x} = \sqrt{1 + \tan^2 x} = \frac{\sqrt{1 + \cot^2 x}}{\cot x} = \frac{\csc x}{\sqrt{\csc^2 x - 1}}.$$

$$\csc x = \frac{1}{\sin x} = \frac{1}{\sqrt{1 - \cos^2 x}} = \frac{\sqrt{1 + \tan^2 x}}{\tan x} = \sqrt{1 + \cot^2 x} = \frac{\sec x}{\sqrt{\sec^2 x - 1}}.$$

If any one of the functions is given, the others may be found from these formulas. It is easier in general to find first the sine and cosine, and then to find the others.

48. Find the Unknown Functions in the Following:

1. $\tan x = -\frac{3}{4}$, x being in the fourth quadrant. Compute the numerical values of the ratios

by the method of Art. 15, and then select the proper signs for the functions in the fourth quadrant. Thus let

$$0 = 3, \quad a = 4, \quad h = 5;$$

$$\sin x = -\frac{3}{5}, \quad \cos x = +\frac{4}{5},$$

$$\cot x = -\frac{4}{3}, \quad \sec x = +\frac{5}{4}, \quad \csc x = -\frac{5}{3}.$$

2. $\tan x = 2$, x being in the third quadrant. Then

$$\sin x = \pm \frac{\tan x}{\sqrt{1 + \tan^2 x}} = -\frac{2}{\sqrt{5}}, \ \cos x = \pm \frac{1}{\sqrt{1 + \tan^2 x}} = -\frac{1}{\sqrt{5}}.$$

These convenient formulas may be easily remembered from Fig. 35. Knowing $\sin x$ and $\cos x$, we have

$$\cot x = \frac{1}{\tan x} = +\frac{1}{2}; \sec x = \frac{1}{\cos x} = -\sqrt{5};$$
$$\csc x = \frac{1}{\sin x} = -\frac{1}{2}\sqrt{5}.$$

^{*} The radicals should be taken with the double sign.

3. $\cot x = -2$, x being in the second quadrant.

$$\cos x = \pm \sqrt{1 + \cot^2 x} = +\sqrt{5}; \sin x = \frac{1}{\csc x} = +\frac{1}{\sqrt{5}};$$
$$\cos x = \pm \sqrt{1 - \sin^2 x} = -\frac{2}{\sqrt{5}}; \tan x = \frac{1}{\cot x} = -\frac{1}{2};$$
$$\sec x = \frac{1}{\cos x} = -\frac{1}{2}\sqrt{5}.$$

4. $\sec x = -\frac{17}{8}$, x being in the third quadrant.

$$\therefore \cos x = \frac{1}{\sec x} = -\frac{8}{17}; \ \sin x = \pm \sqrt{1 - \cos^2 x} = -\frac{15}{17};$$
$$\tan x = \frac{\sin x}{\cos x} = +\frac{15}{8}; \ \cot x = +\frac{8}{15}; \ \csc x = -\frac{17}{15}.$$

- 5. $\sin x = -\frac{4}{5}$, x being in the third quadrant.
- $\cos x = -\frac{3}{5}$; $\tan x = +\frac{4}{3}$; $\cot x = +\frac{3}{4}$; $\sec x = -\frac{5}{3}$; $\csc x = -\frac{5}{4}$.
- 6. $\cos x = +\frac{2}{3}$, x being in the fourth quadrant.

$$\therefore \sin x = -\frac{1}{3}\sqrt{5}; \tan x = -\frac{1}{2}\sqrt{5}; \cot x = -\frac{2}{5}\sqrt{5}; \sec x = +\frac{3}{2}; \\ \csc x = -\frac{3}{5}\sqrt{5}.$$

- 7. $\tan x = -\frac{5}{12}$, x being in the second quadrant.
- $... \sin x = + \frac{5}{13}; \cos x = \frac{12}{13}; \cot x = \frac{12}{5}; \sec x = \frac{13}{12}; \csc x = + \frac{13}{5}.$
 - 8. $\cot x = +\frac{7}{24}$, x being in the third quadrant.

$$\sin x = -\frac{24}{25}$$
; $\cos x = -\frac{7}{25}$

9. $\sec x = -\frac{17}{15}$, x being in the second quadrant.

..
$$\cos x = -\frac{15}{17}$$
; $\sin x = +\frac{8}{17}$; $\tan x = -\frac{8}{15}$.

10. $\csc x = -\frac{41}{9}$, x being in the fourth quadrant.

$$\sin x = -\frac{9}{41}$$
; $\cos x = +\frac{40}{41}$; $\tan x = -\frac{9}{40}$

11. If $\sin \frac{1}{2}\theta = \sqrt{\frac{(s-b)(s-c)}{bc}}$ where $s = \frac{a+b+c}{2}$, show that

$$\cos \frac{1}{2} \theta = \sqrt{\frac{s(s-a)}{bc}}.$$

12. If $\tan \frac{1}{2}\theta = \sqrt{\frac{(s-a)(s-b)}{s(s-c)}}$ where $s = \frac{a+b+c}{2}$, show that

$$\cos \frac{1}{2} \theta = \sqrt{\frac{s(s-c)}{ab}}.$$

13. If $\sec \theta = a$, show that $\sin \theta$ is imaginary if a is numerically less than unity.

$$\sin \theta = \sqrt{1 - \cos^2 \theta} = \sqrt{1 - \frac{1}{\sec^2 \theta}} = \sqrt{1 - \frac{1}{a^2}} = \frac{\sqrt{a^2 - 1}}{a}$$

CROCK. TRIG. - 4

- 14. If $\tan \theta = a$, show that $\csc \theta$ is real for all values of a.
- 15. If $\cos\theta=a$, show that $\csc\theta$ is imaginary when a is numerically greater than unity.
- 49. The Signs of the Functions are given by the formulas of Art. 46, so that it is necessary to remember only that the sine is positive in the first and second quadrants and the cosine in the first and fourth. Thus, in the second quadrant,

$$\tan x = \frac{\sin x}{\cos x} = \frac{+}{-} = -; \cot x = \frac{\cos x}{\sin x} = \frac{-}{+} = -;$$

$$\sec x = \frac{1}{\cos x} = \frac{+}{-} = -; \csc x = \frac{1}{\sin x} = \frac{+}{+} = +.$$

50. Find the Values of the Following Expressions:

1. $\frac{\operatorname{vers} x \tan x - 1}{\sec x}$ when $\tan x = 4$, x being in the third quadrant. Find the numerical values of $\operatorname{vers} x$ and $\sec x$, and substitute.

$$\therefore \cos x = -\frac{1}{\sqrt{17}}, \sec x = -\sqrt{17}, \text{ vers } x = 1 + \frac{1}{\sqrt{17}}.$$

$$\frac{\frac{\sqrt{17}+1}{\sqrt{17}}\cdot 4-1}{-\sqrt{17}} = \frac{4\sqrt{17}+4-\sqrt{17}}{-17} = -\frac{3\sqrt{17}+4}{17}.$$

- 2. $\frac{\sin x \sec x}{\cos x \csc x}$ when vers $x = \frac{3}{4}$, x in the fourth quadrant. Ans. + 15.
- 3. $\frac{\tan x \cot x}{\tan x + \cot x}$ when $\csc x = -\sqrt{5}$, x in the third quadrant. Ans. $-\frac{3}{5}$.
- 4. $\frac{\sec x + \sin x}{\csc x + \cos x}$ when $\cot x = -\frac{1}{2}$, x in the second quadrant. Ans. -2.
- 5. $\frac{\sin x + \tan x}{\cos x + \text{vers } x}$ when $\sec x = -\frac{5}{4}$, x in the third quadrant. Ans. $+\frac{3}{25}$.
- 6. $\frac{\sec x \text{vers } x}{\sec x + \text{vers } x}$ when $\cot x = -2$, x in the second quadrant.

Ans.
$$\frac{9+2\sqrt{5}}{1-2\sqrt{5}} = -\frac{29+20\sqrt{5}}{19}$$
.

- 7. $\frac{\sin x + \tan^2 x}{\cos^2 x + \text{vers}^2 x}$ when $\sec x = -\frac{5}{4}$, x in the second quadrant. Ans. $\frac{465}{1552}$.
- 8. $\frac{\sec x + \sin x}{1 \cot x}$ when $\tan x = 2$, x in the third quadrant. Ans. $-\frac{14}{5}\sqrt{5}$.

9. $\frac{\csc x + \sec x}{\cot x \cos x}$ when $\sec x = +\sqrt{10}$, x in the fourth quadrant.

Ans. -20.

- 10. $\frac{\sec x \csc x}{\sec x + \csc x}$ when $\cot x = -2$, x in the second quadrant. Ans. -3.
- 11. $\frac{\text{vers } x \text{covers } x}{\sec x \csc x}$ when $\sin x = -\frac{2}{3}$, x in the fourth quadrant.

 Ans. $-\frac{2}{3}\sqrt{5}$.

51. Change the Given Expression to Another containing only One Function:

1.
$$\frac{2 \sec^2 x + \sec^2 x \tan^2 x - \sec^4 x}{\sec^2 x - 1}$$
 to contain only cosec x.

It is best generally to change the expression to another containing only $\sin x$ and $\cos x$, and then to change this into one containing the proper function.

$$\therefore \frac{\frac{2}{\cos^2 x} + \frac{\sin^2 x}{\cos^4 x} - \frac{1}{\cos^4 x}}{\frac{1}{\cos^2 x} - 1} = \frac{2 \cos^2 x + \sin^2 x - 1}{\cos^2 x (1 - \cos^2 x)}$$

$$= \frac{2 - 2 \sin^2 x + \sin^2 x - 1}{(1 - \sin^2 x) \sin^2 x} = \frac{1 - \sin^2 x}{(1 - \sin^2 x) \sin^2 x} = \frac{1}{\sin^2 x} = \csc^2 x.$$

2. $\frac{\sin^2 x - \cos^2 x}{\text{vers } x - \text{covers } x}$ to contain only $\tan x$.

$$\therefore \frac{\sin^2 x - \cos^2 x}{1 - \cos x - 1 + \sin x} = \sin x + \cos x = \pm \frac{\tan x}{\sqrt{1 + \tan^2 x}} \pm \frac{1}{\sqrt{1 + \tan^2 x}},$$

where the signs used will depend upon the quadrant of x. The true result is $\pm \frac{1 + \tan x}{\sqrt{1 + \tan^2 x}}$, where the positive sign corresponds to x in the first or fourth quadrant, and the negative to x in the second or third.

Use radicals as little as possible.

- 3. $1 2(1 \cos x)^2 + \frac{\tan^4 x}{(1 + \tan^2 x)^2}$ to contain only $\cos x$. Ans. $\cos^4 x$.
- 4. $\frac{\sec x \csc x 4 \sin x \cos x}{\sin x \sec x}$ to contain only $\sin x$. Ans. $\frac{(1 2 \sin^2 x)^2}{\sin^2 x}$.
- 5. $\frac{(1-\operatorname{covers} x)^2 \operatorname{cosec}^4 x}{(\operatorname{cosec}^2 x-1) \operatorname{cot}^2 x} \text{ to contain only } \tan x. \qquad Ans. \ \tan^2 x + \tan^4 x.$
- 6. $\frac{\sec^2 x \sec^2 x \sin^4 x (1 + \cot^2 x)}{\sin^2 x \cos^2 x}$ to contain only cosec x.

 Ans. $\frac{\csc^4 x}{\csc^2 x 1}$

7.
$$\tan^2\theta \sec^2\theta - \sin^2\theta \cos^2\theta$$
 to contain only $\cot\theta$. Ans. $\frac{1+3\cot^2\theta+3\cot^4\theta}{\cot^4\theta(1+\cot^2\theta)^2}$.

8.
$$\frac{(1-\tan^2 x)^2}{(1+\tan^2 x)^2}(\cos^4 x - \sin^4 x)$$
 to contain only $\sin x$. Ans. $(1-2\sin^2 x)^3$.

9.
$$\frac{\sec^2 \alpha \sin^2 \alpha}{(\tan \alpha + 2 \cot \alpha)^2}$$
 to contain only cosec α . Ans.
$$\frac{1}{(2 \csc^2 \alpha - 1)^2}$$

10.
$$\frac{\sin^2\theta \tan^2\theta}{\sin^2\theta - \cos^2\theta} \text{ to contain only sec } \theta. \qquad Ans. \frac{(\sec^2\theta - 1)^2}{\sec^2\theta - 2}$$

11.
$$\frac{\sec^2\theta\csc^2\theta+\sec^2\theta-\csc^2\theta-1}{\tan^2\theta-\csc^2\theta+1} \text{ to contain only cot } \theta. \quad \textbf{Ans. } \frac{\cot^2\theta+2}{1-\cot^4\theta}$$

52. Solution of Trigonometric Equations. — Transform the given equation into one containing only a single function (usually the sine or cosine), because in a single equation we must have only one unknown quantity. Then solve the equation algebraically for this function as the unknown quantity. The corresponding angle may then be found from the tables. Test the angles by substitution in the given equation.

1.
$$\sin \theta \cos \theta = +\frac{1}{2}$$
.

$$\therefore \sin \theta \sqrt{1 - \sin^2 \theta} = + \frac{1}{2}; \quad \therefore \sin^2 \theta (1 - \sin^2 \theta) = \frac{1}{4};$$
$$\therefore \sin^4 \theta - \sin^2 \theta + \frac{1}{4} = 0; \quad \therefore \sin^2 \theta - \frac{1}{2} = 0; \quad \therefore \sin \theta = \pm \sqrt{\frac{1}{2}}.$$

 \therefore θ might be 45°, 135°, 225°, or 315°. But the given equation shows that the product of the sine and cosine must be positive, and hence that they must have the same sign. Both the sine and cosine are positive in the first quadrant, and negative in the third, but they have contrary signs in the second and fourth quadrants. Hence the only admissible values of θ are 45° and 225°.

```
2. \tan \theta \sec \theta = -\sqrt{2}. \therefore \theta = 225^{\circ}, 315^{\circ}.
```

3.
$$\csc \theta = \frac{2}{3} \tan \theta$$
. $\therefore \theta = 60^{\circ}, 300^{\circ}$.

4.
$$\tan \theta + \cot \theta = 2$$
. $\therefore \theta = 45^{\circ}, 225^{\circ}$.

5.
$$\sec^2 \theta + \csc^2 \theta = 4$$
. $\therefore \theta = 45^{\circ}, 135^{\circ}, 225^{\circ}, 315^{\circ}$.

6.
$$\sin \theta = \pm \sqrt{3} \text{ vers } \theta$$
. $\therefore \theta = 0^{\circ}, 60^{\circ}, 300^{\circ}$.

7.
$$\sec \theta + \tan \theta = \pm \sqrt{3}$$
. $\therefore \theta = 30^{\circ}, 150^{\circ}$. [300°, 330°.

8.
$$\sec^2 \theta + \cot^2 \theta = \frac{13}{3}$$
. $\therefore \theta = 30^\circ, 60^\circ, 120^\circ, 150^\circ, 210^\circ, 240^\circ,$

9.
$$\sin x = +\sqrt{3}\cos x$$
. $\therefore x = 60^{\circ}, 240^{\circ}$.

10.
$$\tan x = -2\sqrt{3}\cos x$$
. $\therefore x = 240^{\circ}, 300^{\circ}$.

11.
$$\sin x \cos x = -\frac{1}{4}\sqrt{3}$$
. $x = 120^{\circ}, 150^{\circ}, 300^{\circ}, 330^{\circ}$.

12.
$$\sin \theta + \csc \theta = -\frac{5}{2}$$
. $\therefore \theta = 210^{\circ}, 330^{\circ}$.

13.
$$3 \sin x = 2 \cos^2 x$$
 ... $x = 30^\circ$, 150°.

14.
$$\sec x \tan x = +2\sqrt{3}$$
. $\therefore x = 60^{\circ}, 120^{\circ}$.

15. $\sec \theta \ \text{vers} \ \theta = 1 - \tan \theta$.

$$\therefore \frac{1}{\cos \theta} (1 - \cos \theta) = 1 - \frac{\sin \theta}{\cos \theta}; \quad \therefore \sin \theta = 2 \cos \theta - 1;$$

 $\sin^2 \theta = 4\cos^2 \theta - 4\cos \theta + 1$; $\sin^2 \theta = 4\cos^2 \theta - 4\cos \theta + 1$;

$$\therefore 5\cos^2\theta - 4\cos\theta = 0; \quad \therefore \cos\theta (5\cos\theta - 4) = 0;$$

$$\therefore$$
 cos $\theta = 0$ and $5 \cos \theta - 4 = 0$.

- (a) $\cos \theta = 0$ gives $\theta = 90^{\circ}$ or 270°. These values are rejected for reasons involving the methods of the Differential Calculus.
- (b) $\cos \theta = \frac{4}{5}$ gives $\sin \theta = \pm \frac{3}{5}$, since this value of the cosine will allow the angle to lie either in the first or in the fourth quadrant. Transposing in the original equation, we have

$$\sec\theta\,\operatorname{vers}\theta+\tan\theta-1=0,$$

and we test by substitution. For θ in the first quadrant, we have

$$\frac{5}{4} \cdot \frac{1}{5} + \frac{3}{4} - 1 = 0,$$

showing that θ has a value in the first quadrant. For θ in the fourth quadrant, we have

$$\tfrac{5}{4} \cdot \tfrac{1}{5} - \tfrac{3}{4} - 1 = -\,\tfrac{3}{2},$$

not zero; and hence θ does not have a value in the fourth quadrant.

- 16. $\sin x \tan x = -\frac{9}{20}$. . . $\sin x = \pm \frac{3}{5}$, $\cos x = -\frac{4}{5}$; quadrants II. and III.
- 17. vers x = 2 covers x. \therefore cos $x = \frac{3}{5}$ or -1; first quadrant, and 180°.
- 18. $\sin x \tan x = 2 \cos x$. $\therefore \sin x = \pm \sqrt{\frac{2}{3}}$, $\cos x = \pm \sqrt{\frac{1}{3}}$; four quadrants.
- 19. $\sec x \csc x = -2$ $\sin x = \pm \frac{1}{2}\sqrt{2}$, $\cos x = \mp \frac{1}{2}\sqrt{2}$; 135° and 315°.
- 20. $\cos x \cot x = -\frac{5}{2}$. $\sin x = -\frac{2}{3}$; quadrants III. and IV.
- **21.** $\sin x \cos x = -\frac{12}{25}$. $\therefore \sin x = \pm \frac{4}{5}$ or $\pm \frac{3}{5}$; quadrants II. and IV.
- 22. $\tan x = -\sqrt{20}\cos x$. . . $\sin x = -\frac{2}{\sqrt{5}}$; quadrants III. and IV.
- 23. $\sec x + \tan x = 2$. $\therefore \tan x = +\frac{3}{4}$; first quadrant.
- 24. $\sec x \tan 2x (1-2\cos x)=0$.

The values of x are found by placing each factor equal to zero, and solving the resulting equations. Hence we have

$$\sec x = 0$$
, $\tan 2x = 0$, $1-2\cos x = 0$.

31. $\sin 2x \text{ vers } 3x = 0.$

But $\sec x = 0$ is impossible; $\tan 2x = 0$ gives $2x = 0^{\circ}$ or 180° , and, using the general measures of the angles, $x = 0^{\circ}$, 90° , 180° , 270° , the second and the last values being inadmissible. $1 - 2\cos x = 0$ gives $\cos x = \frac{1}{2}$, and $x = 60^{\circ}$ or 300° .

25.
$$\tan \frac{1}{2} x = 0$$
. $\therefore x = 0^{\circ}$.
26. $\operatorname{vers} 3 x = 0$. $\therefore x = 0^{\circ}$, 120° , 240° .
27. $\sin x \cos x (1 + 2 \cos x) = 0$. $\therefore x = 0^{\circ}$, 90° , 180° , 270° , 120° , 240° . [330°.
28. $\cos 2 x (3 - 4 \cos^{2} x) = 0$. $\therefore x = 45^{\circ}$, 225° , 135° , 315° , 30° , 150° , 210° , 29. $(1 + \tan x)(1 - 2 \sin x) = 0$. $\therefore x = 45^{\circ}$, 225° , 30° , 150° .
30. $\tan x = -2 \sin x$. $\therefore x = 0^{\circ}$, 120° , 180° , 240° .

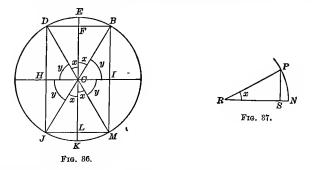

53. The Functions of an Angle Greater than 360° are the same as those of the angle less than 360°, found by increasing or diminishing the given angle by some multiple of 360°; for the position of the terminal side would not be changed by these operations. Thus

 $x = 0^{\circ}$, 90°, 180°, 120°, 240°, 270°.

$$\tan 1010^{\circ} = \tan (1010^{\circ} - 720^{\circ}) = \tan 290^{\circ};$$

 $\cos (-835^{\circ}) = \cos (-835^{\circ} + 720^{\circ}) = \cos (-115^{\circ}),$
or $\cos (-835^{\circ}) = \cos (-835^{\circ} + 1080^{\circ}) = \cos 245^{\circ}.$

54. The Functions of $90^{\circ} \pm x$ and of $270^{\circ} \pm x$ are numerically equal to the cofunctions of x, but may differ from them in signs. Let the arcs EB, ED, KJ, KM, and NP be equal,

the radii CB and RP each being unity. Then the right triangles FCB, FCD, LCJ, LCM, and SRP are equal, having

the same hypotenuse (unity) and the angle x the same in each. Therefore

$$FB = CI = LM = DF = HC = JL = SP,$$
and
$$CF = IB = HD = LC = MI = JH = RS.$$

$$\therefore \sin (90^{\circ} - x) = IB = CF = RS = +\cos x;$$

$$\cos (90^{\circ} - x) = CI = FB = SP = +\sin x.$$

$$\sin (90^{\circ} + x) = HD = CF = RS = +\cos x;$$

$$\cos (90^{\circ} + x) = CH = FD = -DF^* = -SP = -\sin x.$$

$$(2)$$

$$\sin (270^{\circ} - x) = HJ = CL = -LC^* = -RS = -\cos x;$$

$$\cos (270^{\circ} - x) = CH = LJ = -JL^* = -SP = -\sin x.$$

$$\sin (270^{\circ} + x) = IM = CL = -LC^* = -RS = -\cos x;$$

$$\cos (270^{\circ} + x) = IM = CL = -LC^* = -RS = -\cos x;$$

$$\cos (270^{\circ} + x) = CI = LM = SP = +\sin x.$$
(4)

Thus
$$\sin 100^{\circ} = \sin (90^{\circ} + 10^{\circ}) = +\cos 10^{\circ};$$

$$\cos 100^{\circ} = \cos (90^{\circ} + 10^{\circ}) = -\sin 10^{\circ}.$$

$$\sin 200^{\circ} = \sin (270^{\circ} - 70^{\circ}) = -\cos 70^{\circ};$$

$$\cos 200^{\circ} = \cos (270^{\circ} - 70^{\circ}) = -\sin 70^{\circ}.$$

$$\sin 300^{\circ} = \sin (270^{\circ} + 30^{\circ}) = -\cos 30^{\circ};$$

$$\cos 300^{\circ} = \cos (270^{\circ} + 30^{\circ}) = +\sin 30^{\circ}.$$

55. The Functions of $180^{\circ} \pm y$ and of $360^{\circ} - y$ are numerically equal to the *same* functions of y, but may differ from them in signs. From Fig. 36,

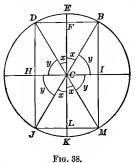

$$\sin (180^{\circ} - y) = HD = IB = + \sin y;
\cos (180^{\circ} - y) = CH = -HC^{*} = -CI = -\cos y.$$

$$\sin (180^{\circ} + y) = HJ = -JH^{*} = -IB = -\sin y;
\cos (180^{\circ} + y) = CH = -HC^{*} = -CI = -\cos y.$$

$$\sin (360^{\circ} - y) = IM = -MI^{*} = -IB = -\sin y;
\cos (360^{\circ} - y) = CI = +\cos y.$$
(3)

Thus $\sin 100^{\circ} = \sin (180^{\circ} - 80^{\circ}) = +\sin 80^{\circ};
\cos 100^{\circ} = \cos (180^{\circ} - 80^{\circ}) = -\cos 80^{\circ}.
\sin 200^{\circ} = \sin (180^{\circ} + 20^{\circ}) = -\sin 20^{\circ};
\cos 200^{\circ} = \cos (180^{\circ} + 20^{\circ}) = -\cos 20^{\circ}.
\sin 300^{\circ} = \sin (360^{\circ} - 60^{\circ}) = -\sin 60^{\circ};
\cos 300^{\circ} = \cos (360^{\circ} - 60^{\circ}) = +\cos 60^{\circ}.$

56. The Functions of a Negative Angle are numerically equal to the same functions of an equal positive angle, but may differ from them in signs.

 $\sec(-x) = +\sec x$;

$$\sin (-y) = IM = -MI^* = -IB
= -\sin y;
\cos (-y) = CI = +\cos y.$$
(1)

Thus

$$\sin (x-180^{\circ}) = \sin [-(180^{\circ}-x)]$$

$$= -\sin (180^{\circ}-x) = -\sin x.$$

$$\cos (x-180^{\circ}) = \cos [-(180^{\circ}-x)]$$

$$= +\cos (180^{\circ}-x) = -\cos x.$$

57. Summary. — Using the equations of Art. 46,

$$\tan x = \frac{\sin x}{\cos x}$$
, $\cot x = \frac{\cos x}{\sin x}$, $\sec x = \frac{1}{\cos x}$, $\csc x = \frac{1}{\sin x}$

and the results of Arts. 54, 55, and 56, we have

$$\sin (90^{\circ} - x) = + \cos x; \qquad \cos (90^{\circ} - x) = + \sin x; \\
\tan (90^{\circ} - x) = + \cot x; \qquad \cot (90^{\circ} - x) = + \tan x; \\
\sec (90^{\circ} - x) = + \csc x; \qquad \csc (90^{\circ} - x) = + \cot x; \\
\sin (90^{\circ} + x) = + \cos x; \qquad \cos (90^{\circ} + x) = - \sin x; \\
\tan (90^{\circ} + x) = - \cot x; \qquad \cot (90^{\circ} + x) = - \tan x; \\
\sec (90^{\circ} + x) = - \cot x; \qquad \cot (90^{\circ} + x) = - \tan x; \\
\sec (90^{\circ} + x) = - \csc x; \qquad \csc (90^{\circ} + x) = + \sec x.$$

$$\sin (180^{\circ} - x) = + \sin x; \qquad \cos (180^{\circ} - x) = - \cot x; \\
\sec (180^{\circ} - x) = - \tan x; \qquad \cot (180^{\circ} - x) = - \cot x; \\
\sec (180^{\circ} - x) = - \sec x; \qquad \cos (180^{\circ} - x) = + \csc x.$$

$$\sin (180^{\circ} + x) = - \sin x; \qquad \cot (180^{\circ} + x) = - \cos x; \\
\tan (180^{\circ} + x) = - \sin x; \qquad \cot (180^{\circ} + x) = - \cos x; \\
\tan (180^{\circ} + x) = - \sin x; \qquad \cot (180^{\circ} + x) = - \csc x.$$

$$\sin (270^{\circ} - x) = - \cos x; \qquad \cos (270^{\circ} - x) = - \sin x; \\
\sec (270^{\circ} - x) = - \cos x; \qquad \cot (270^{\circ} - x) = - \sec x.$$

$$\sin (270^{\circ} + x) = - \cos x; \qquad \cot (270^{\circ} + x) = + \sin x; \\

\cot (360^{\circ} - x) = - \cot x; \qquad \cot (360^{\circ} - x) = - \cot x; \\
\cot (360^{\circ} - x) = - \cot x; \qquad \cot (360^{\circ} - x) = - \cot x; \\
\cot (360^{\circ} - x) = - \cot x; \qquad \cot (360^{\circ} - x) = - \cot x;$$

 $\operatorname{cosec}(-x) = -\operatorname{cosec}x$

(8)

^{*} See Art. 2.

These formulas may be remembered from the three facts:

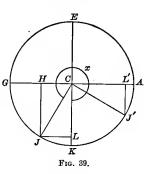

- (a) Whenever the angle is $90^{\circ} \pm x$, or $270^{\circ} \pm x$, the functions of the angle are numerically equal to the corresponding cofunctions of x.
- (b) Whenever the angle is $180^{\circ} \pm x$, $360^{\circ} x$, or -x, the functions of the angle are numerically equal to the same functions of x.
- (c) The sign to be placed before the function of x is that of the original function when x is less than 90°. Thus

$$\sin(270^\circ + x) = -\cos x,$$

since, when $x < 90^{\circ}$, $270^{\circ} + x$ will be in the fourth quadrant, and $\sin(270^{\circ} + x)$ will therefore be negative.

58. General Method of Proof. — In Arts. 54, 55, and 56, both x and y were less than 90°, but the formulas in Art. 57

are true for all values of x. Suppose, for example, that we wish to prove the formulas for $270^{\circ} + x$ when x is in the fourth quadrant, that is, when x is between 270° and 360° . Let KAEGJ=x; then $AEGJKAEGJ=270^{\circ} + x$. Let AEGKJ'=x. Then in the right triangles JCL and J'CL' the angles JCL and J'CL' are equal, each being $360^{\circ} - x$; therefore the triangles

are equal, and CL = CL' and LJ = L'J' numerically. Algebraically CL = -CL' and LJ = +L'J'.

$$\therefore \sin (270^{\circ} + x) = HJ = CL = -CL' = -\cos x; \\ \cos (270^{\circ} + x) = CH = LJ = +L'J' = +\sin x.$$

EXAMPLES.

- 1. From the preceding equations prove that
- (a) $\tan (-1200^{\circ}) = \cot 30^{\circ}$.
- (b) $\sec 1000^{\circ} = \csc 10^{\circ}$.
- (c) $\cos (-890^{\circ}) = -\cos 10^{\circ}$.
- (d) $\cot 1700^{\circ} = \cot 80^{\circ}$.
- (e) $\csc(-1235^{\circ}) = -\sec 65^{\circ}$.
- $(f) \sin 1340^{\circ} = -\cos 10^{\circ}.$

- $(g) \sin (-3000^{\circ}) = -\cos 30^{\circ}$.
- (h) $\cos 1300^{\circ} = -\cos 40^{\circ}$.
- (i) $\tan 3200^{\circ} = -\tan 40^{\circ}$.
- $(j) \cot (-1300^{\circ}) = -\cot 40^{\circ}.$
 - $(k) \sec (-2900^{\circ}) = + \sec 20^{\circ}.$
- (1) $\csc 2420^{\circ} = -\sec 10^{\circ}$.

- 2. If $\tan \theta = -\cot 140^{\circ}$, find the two values of θ less than 360° ... $\tan \theta = -\cot (90^{\circ} + 50^{\circ}) = +\tan 50^{\circ}$ $\theta = 50^{\circ}$, 230°.
- 3. Find the values of θ in the following equations:
 - .: 230°, 310°. $\sin\theta = +\cos 220^{\circ}.$ (a)
 - $\sin \theta = + \cos 310^{\circ}$ 40°, 140°. (b)
 - . . 60°, 120°. $\sin \theta = -\cos 210^{\circ}$. (c)
 - $(d) \quad \sin^2\theta = +\cos^2200^\circ.$ ·. 70°, 110°, 250°, 290°.
 - .∴ 60°, 300°. (e) $\cos \theta = + \sin 150^{\circ}$.
 - $\cos \theta = + \sin 250^{\circ}$ 160°, 200°. (f)
 - (g) $\cos \theta = -\sin 170^{\circ}$ 100°, 260°.
 - (h) $\cos \theta = -\sin 275^{\circ}$ 5°, 355°.
 - (i) $\cos^2 \theta = + \sin^2 100^\circ$. .. 10°, 350°, 170°, 190°.
 - . . 170°, 350°. $\tan \theta = + \cot 100^{\circ}$. (j)
 - ... 70°, 250°. (k) $\tan \theta = + \cot 200^{\circ}$.
 - ... 140°, 320°. (l) $\tan \theta = -\cot 230^{\circ}$.
 - ∴ 10°, 190°. (m) $\cot \theta = + \tan 260^{\circ}$.
 - (n) $\cot \theta = + \tan 345^{\circ}$ 105°, 285°.
 - (o) $\cot \theta = -\tan 245^{\circ}$. .: 155°, 335°.
 - $\cot \theta = \tan 305^{\circ}$. .. 35°, 215°. (p)
 - (q) $\sec \theta = -\csc 100^{\circ}$ 170°, 190°.
 - .: 40°, 320°. $\sec \theta = + \csc 130^{\circ}$.
 - (r)
 - $\sec \theta = + \csc 310^{\circ}$. . 140°, 220°. (s)
 - (u) $\csc \theta = + \sec 230^{\circ}$. .: 220°, 320°.
 - ... 85°, 95°. (v) $\csc \theta = -\sec 185^{\circ}$.
 - (w) $\csc \theta = -\sec 335^{\circ}$. .: 245°, 295°.
 - (x) $\csc^2 \theta = + \sec^2 250^\circ$. . 20°, 160°, 200°, 340°.

. . 45°, 135°.

- $\sec \theta = -\csc 290^{\circ}$. .. 20°, 340°. (y)
- (z) $\sin \theta = -\cos 300^{\circ}$. .: 210°, 330°.
- **4.** $\cos \theta = \sin 2 \theta$. Show that one value of θ is 30°.
- 5. $\tan n \theta = -\cot 120^{\circ}$. Show that one value of θ is $30^{\circ} \div n$.
- 6. $\sec 3\theta = \csc (n-1)\theta$. Show that one value of θ is $90^{\circ} \div (n+2)$.
- 7. If $\cot 309^{\circ} = -\frac{8}{10}$, find $\sin 219^{\circ}$.

(t) $\csc \theta = + \sec 315^{\circ}$.

 $\sin 219^{\circ} = \sin (180^{\circ} + 39^{\circ}) = -\sin 39^{\circ}$. But $\cot 309^{\circ} = \cot (270^{\circ} + 39^{\circ}) =$ $-\tan 39^\circ$; $\therefore \tan 39^\circ = +\frac{8}{10}$. $\therefore \sin 39^\circ = \frac{\tan 39^\circ}{\sqrt{1+\tan^2 39^\circ}} = \frac{8}{\sqrt{164}} = \frac{4}{\sqrt{41}}$ $\sin 219^{\circ} = -\frac{4}{\sqrt{41}}$

- 8. If $\sin 217^{\circ} = -\frac{6}{10}$, prove that $\tan 127^{\circ} = -\frac{4}{3}$.
- 9. If $\cos 125^{\circ} = -a$, prove that $\tan 325^{\circ} = -\frac{a}{\sqrt{1-a^2}}$

- 10. If $\cot 260^\circ = +a$, prove that $\cos 350^\circ = +\frac{1}{\sqrt{1+a^2}}$.
- 11. If sec $340^{\circ} = + a$, prove that $\sin 110^{\circ} = \frac{1}{a}$, and $\tan 110^{\circ} = -\frac{1}{\sqrt{a^2 1}}$.
- 12. If $\cos 300^\circ = +a$, prove that $\cot 120^\circ = -\frac{a}{\sqrt{1-a^2}}$
- 13. If $\sin 115^{\circ} = +a$, prove that $\frac{\tan 205^{\circ} \sec 245^{\circ}}{\csc 335^{\circ}} = +\frac{\sqrt{1-a^2}}{a}$.
- 14. If $\cos 200^{\circ} = -m$, prove that $\tan 110^{\circ} \csc 250^{\circ} \cot 290^{\circ} = -\frac{1}{m}$.
- 15. If cosec $185^{\circ} = -m$, prove that $\tan 355^{\circ} \tan 275^{\circ} \cos 175^{\circ} = -\frac{\sqrt{m^2 1}}{2}$.
- 16. Show that $\cot \frac{1}{6}(-x-540^{\circ}) = \tan \frac{1}{6}x$.

$$\cot \frac{1}{6}(-x - 540^{\circ}) = \cot (-\frac{1}{6}x - 90^{\circ})$$

$$= \cot [-(90^{\circ} + \frac{1}{6}x)] = -\cot (90^{\circ} + \frac{1}{6}x) = +\tan \frac{1}{6}x.$$

- 17. Show that $\sin (y 90^{\circ}) = -\cos y$.
- **18.** Show that $\sin (y 180^{\circ}) = -\sin y$.
- 19. Show that $\cos (y 270^{\circ}) = -\sin y$.
- **20.** Show that $\sec (-x 540^{\circ}) = -\sec x$.
- 21. Show that $\tan (y 360^{\circ}) = + \tan y$.
- 22. Show that $\cos \frac{1}{3}(x-270^\circ) = + \sin \frac{1}{3}x$. [Note that 270° in the parenthesis is to be multiplied by $\frac{1}{3}$.]
 - 23. Show that $\cos \frac{1}{3}(-810^{\circ} + a b) = -\sin \frac{1}{3}(a b)$.
 - **24.** Show that $\csc \frac{1}{4}(x 360^{\circ}) = -\sec \frac{1}{4}x$.
 - 25. Show that $\sec \frac{1}{5}(-900^{\circ} x) = -\sec \frac{1}{5}x$.
 - **26.** Show that $\tan \frac{1}{2}(360^{\circ} + a b) = + \tan \frac{1}{2}(a b)$.
- 27. Show that $\cos (180^{\circ} x)$ is equal to the sine of the complementary angle.

Complement =
$$90^{\circ} - (180^{\circ} - x) = -(90^{\circ} - x)$$
; $\sin [-(90^{\circ} - x)] = -\sin (90^{\circ} - x) = -\cos x$. But $\cos (180^{\circ} - x) = -\cos x$. $\cos (180 - x) = \sin [90^{\circ} - (180^{\circ} - x)]$.

- 28. Show that $\csc(270^{\circ} x)$ equals the secant of the complementary angle.
- 29. Show that $\tan (180^{\circ} + x)$ equals the cotangent of the complementary angle.
- 30. Show that sec $(270^{\circ} + x)$ equals the cosecant of the complementary angle.
 - 31. Show that $\cos(90^{\circ}+x)$ equals the sine of the complementary angle.
 - 32. Show that $\cot (360^{\circ} x)$ equals the tangent of the complementary angle.
- 33. Show that $\tan (270^{\circ}+x)$ is equal to the negative of the tangent of the supplementary angle.

Supplement = $180^{\circ} - (270^{\circ} + x) = -(90^{\circ} + x)$; $\tan [-(90^{\circ} + x)] = -\tan (90^{\circ} + x) = +\cot x$. But $\tan (270^{\circ} + x) = -\cot x$. $\tan (270^{\circ} + x) = -\tan [180^{\circ} - (270^{\circ} + x)]$.

34. Show that cosec ($180^{\circ} + x$) is equal to the cosecant of the supplementary angle.

- 35. Show that $\sin (360^{\circ} x)$ is equal to the sine of the supplementary angle.
- 36. Show that $\sec{(90^{\circ} + x)}$ is equal to the negative of the secant of the supplementary angle.
- 37. Show that $\cos (270^{\circ}-x)$ is equal to the negative of the cosine of the supplementary angle.
- 38. Show that $\cot (270^{\circ} + x)$ is equal to the negative of the cotangent of the supplementary angle.
- 59. The Trigonometric Tables. The relations shown in Arts. 53 and 57 enable us to find the functions of any angle, although the tables contain only the sines, cosines, tangents, and cotangents of angles less than 45°. For, since

$$\sin (90^{\circ} - x) = \cos x$$
, $\cos (90^{\circ} - x) = \sin x$,
 $\tan (90^{\circ} - x) = \cot x$, $\cot (90^{\circ} - x) = \tan x$,

the tables are immediately extended to 90° by writing the proper degrees and minutes at the bottom and on the right of the page respectively.

Then, since the value of any function of an angle greater than 90° can be found in terms of a function of an angle less than 90°, we can find the numerical value of the function from the tables.

1. Find from the tables the logarithmic functions of 580° 42'.4.

$$580^{\circ} 42'.4 = 360^{\circ} + 220^{\circ} 42'.4.$$

 $\begin{array}{c} \therefore \sin 580^{\circ} \, 42'.4 = \sin 220^{\circ} \, 42'.4 = \sin (180^{\circ} + 40^{\circ} \, 42'.4) = -\sin 40^{\circ} \, 42'.4 \, ; \\ \qquad \qquad \qquad \cdot \cdot \cdot \log \sin 580^{\circ} \, 42'.4 = 9.81437 \, n. \\ \cos 580^{\circ} \, 42'.4 = -\cos 40^{\circ} \, 42'.4 \, ; \quad \cdot \cdot \cdot \log \cos 580^{\circ} \, 42'.4 = 9.87971 \, n. \\ \tan 580^{\circ} \, 42'.4 = +\tan 40^{\circ} \, 42'.4 \, ; \quad \cdot \cdot \cdot \log \tan 580^{\circ} \, 42'.4 = 9.93467. \\ \cot 580^{\circ} \, 42'.4 = +\cot 40^{\circ} \, 42'.4 \, ; \quad \cdot \cdot \cdot \log \cot 580^{\circ} \, 42'.4 = 0.06533. \end{array}$

2. Find from the tables the logarithmic functions of the following angles:

Angle. 499° 29′.7.	log sin. 9.81258.	$\log \cos$. 9.88102 n .	log tan. 9.93158 n.	0.06842 n.
597° 8′.3. 689° 27′.6.	9.92427 n. $9.70598 n.$	9.73449 n. 9.93514.	0.18978. 9.77084 n.	9.81022. $0.22916 n.$

- 3. $\sin b = \tan 250^{\circ} 15'.5 \cot 278^{\circ} 17'.3$; find $b = 203^{\circ} 57'.0$ or $336^{\circ} 3'.0$.
- **4.** $\cos \beta = \cos 149^{\circ} 27'.6 \sin 216^{\circ} 44'.0$; find $\beta = 58^{\circ} 59'.7$ or $301^{\circ} 0'.3$.
- 5. $\tan \alpha = \sin 319^{\circ} 52'.0 \div \cot 254^{\circ} 30'.2$; find $\alpha = 113^{\circ} 16'.5$ or $293^{\circ} 16'.5$.
- 6. $\cot c = \cos 216^{\circ} 44'.0 \div \tan 329^{\circ} 27'.6$; find $c = 36^{\circ} 21'.6$ or $216^{\circ} 21'.6$.

60. Transform the First Member into the Second in the following examples. Usually it is best to change the given expression into one containing the sine and cosine, and then to change this into the required form. Any operation is admissible that does not change the value of the expression. Use radicals only when unavoidable. If the expression is factored, it is often advantageous to reduce each factor separately, not multiplying until it becomes necessary.

1.
$$\frac{\tan x - \sin x}{\sin^3 x} = \frac{\sec x}{1 + \cos x}.$$

$$\frac{\tan x - \sin x}{\sin^3 x} = \frac{\frac{\sin x}{\cos x} - \sin x}{\sin^3 x} = \frac{\sin x (1 - \cos x)}{\cos x \sin^3 x} = \frac{1 - \cos x}{\cos x \sin^2 x}$$

$$= \frac{1 - \cos x}{\cos x (1 - \cos^2 x)} = \frac{1}{\cos x (1 + \cos x)} = \frac{\sec x}{1 + \cos x}.$$

- 2. $\cos x \tan x + \sin x \cot x = \sin x + \cos x$.
- 3. $(2 \operatorname{vers} x) \operatorname{vers} x = \sin^2 x$.
- 4. $\frac{\cos x}{\sin x \cot^2 x} = \tan x.$
- 5. $(\tan x + \cot x) \sin x \cos x = 1$.
- 6. $(\sec^2 x 1)(\csc^2 x 1) = 1$.
- 7. $\sec x \csc x (\cos^2 x \sin^2 x) = \cot x \tan x$.
- 8. $(\sin x + \cos x)(\tan x + \cot x) = \sec x + \csc x$.
- 9. $\cot x + \frac{\sin x}{1 + \cos x} = \csc x$.
- 10. $\sin x (\sec x + \csc x) \cos x (\sec x \csc x) = \sec x \csc x$.
- 11. $(\csc x \cot x)^2 = \frac{1 \cos x}{1 + \cos x}$
- 12. $(1 + \tan^2 x)(1 \cot^2 x) = \sec^2 x \csc^2 x$.
- 13. $\frac{\tan x \cot x}{\tan x + \cot x} = \frac{2}{\csc^2 x} 1$. [First change to an expression containing only $\sin x$, the reciprocal of $\csc x$.]
- 14. $\sec^2 x \csc^2 x 2 = \tan^2 x + \cot^2 x$. [Substitute for $\sec x$ and $\csc x$ their values in terms of $\tan x$ and $\cot x$ respectively.]
 - 15. $\frac{\tan \alpha + \tan \beta}{\cot \alpha + \cot \beta} = \tan \alpha \tan \beta.$
- 16. $\cot x \sec x \csc x (1 2\sin^2 x) = \tan x$. [The expression reduces to $\sin x \div \cos x$.]

- 17. $\csc x (\sec x 1) \cot x (1 \cos x) = \tan x \sin x$. [Factor as soon as possible, and reduce each factor separately.]
 - 18. $\operatorname{vers} x (\operatorname{sec} x + 1) + \operatorname{covers} x (\operatorname{cosec} x + 1) = \sin x \tan x + \cos x \cot x$.
 - 19. $\frac{\operatorname{vers} x (1 + \sec x)}{\sin x} + \frac{\operatorname{covers} x (1 + \csc x)}{\cos x} = \sec x \csc x.$
 - 20. $\sin^2 x (\tan^2 x 1) + \cos^2 x (\cot^2 x 1) = \frac{(1 2\cos^2 x)^2 \sec^4 x}{\tan^2 x}$
 - 21. $\sec x \csc x [\operatorname{vers} x (\operatorname{vers} x 2) \operatorname{covers} x (\operatorname{covers} x 2)] = \cot x \tan x$.
 - 22. $\cos^4 x \sin^4 x = \cos x (1 \tan x) (\sin x + \cos x)$.
- 23. $\frac{\operatorname{vers} x (1 + \cos x) \operatorname{covers} x (1 + \sin x)}{\operatorname{sec}^2 x \operatorname{cosec}^2 x} = \frac{\tan^4 x \tan^2 x}{\operatorname{sec}^6 x}$ [Change to an expression containing only $\sin x$ and $\cos x$, and then substitute their values

an expression containing only $\sin x$ and $\cos x$, and then substitute their values in terms of $\tan x$.

- 24. $\frac{\sec^2 x \sin^2 x \csc^2 x + \csc^2 x \cos^2 x}{\sec^2 x \sin^2 x \csc^2 x \cos^2 x} = \sin^2 x.$
- 25. $\tan^2 x \sin^2 x \cos^2 x = \frac{(\sec^2 x + 1)(\sec^2 x 1)^2}{\sec^4 x}$.
- 26. $\frac{\cos x \cot x \sin x \tan x}{\csc x \sec x} = 1 + \sin x \cos x.$
- 27. $\frac{(\sec x + \csc x)^2}{\tan x + \cot x} = \frac{(1 + \tan x)^2}{\tan x}.$
- 28. $2 + \frac{\sin^4 x + \cos^4 x}{\sin^2 x \cos^2 x} = \sec^2 x + \csc^2 x$.
- 29. $\frac{\sec x + \csc x}{\sec x \csc x} = \frac{\tan x + 1}{\tan x 1} = \frac{1 + \cot x}{1 \cot x}$
- 30. $\frac{\sin x \tan^2 x \text{ covers } x}{\csc x \cot^2 x} = \frac{\sin^4 x}{(1 + \sin x) \cos^2 x}$
- 31. $\sec^2 x \csc^2 x \left[\operatorname{vers} x \left(\operatorname{vers} x 2 \right) \operatorname{covers} x \left(\operatorname{covers} x 2 \right) \right]$ = $\cot^2 x - \tan^2 x$.
- 32. $\tan x + \cot x = \frac{\sec^2 x + \csc^2 x}{\sec x \csc x}$ [1t is admissible to divide both numerator and denominator by $\sin^2 x \cos^2 x$.]
 - 33. $\tan^2 \alpha \tan^2 \beta 1 = \frac{\sin^2 \alpha \cos^2 \beta}{\cos^2 \alpha \cos^2 \beta} = \frac{\sin^2 \beta \cos^2 \alpha}{\cos^2 \alpha \cos^2 \beta}$
 - 34. $\frac{1-\tan^2\alpha\tan^2\beta}{\tan^2\alpha\tan^2\beta} = \frac{\cos^2\alpha \sin^2\beta}{\sin^2\alpha\sin^2\beta} = \frac{\cos^2\beta \sin^2\alpha}{\sin^2\alpha\sin^2\beta}$
 - 35. $\sin^2 x \tan^2 x + \cos^2 x \cot^2 x = \tan^2 x + \cot^2 x 1$.
 - 36. $\sin^2 x \tan x + \cos^2 x \cot x + 2 \sin x \cos x = \sec x \csc x$.
- 37. $\sec^4x + \tan^4x = 1 + 2\sec^2x \tan^2x$. [It is admissible to add and subtract $2\sec^2x \tan^2x$.]
 - 38. $(r\cos\phi)^2 + (r\sin\phi\sin\theta)^2 + (r\sin\phi\cos\theta)^2 = r^2$.
 - $r^{2}\cos^{2}\phi + r^{2}\sin^{2}\phi (\sin^{2}\theta + \cos^{2}\theta) = r^{2}(\cos^{2}\phi + \sin^{2}\phi) = r^{2},$ since $\sin^{2}x + \cos^{2}x = 1$.

- 39. $(2 r \sin \alpha \cos \alpha)^2 + r^2 (\cos^2 \alpha \sin^2 \alpha)^2 = r^2$.
- **40.** $(a\sin\gamma)^2 + (a\cos\gamma\sin\delta)^2 + (a\cos\gamma\cos\delta)^2 = a^2$.
- **41.** $(\cos a \cos b \sin a \sin b)^2 + (\sin a \cos b + \cos a \sin b)^2 = 1$.
- **42.** $(\cos a \cos b + \sin a \sin b)^2 + (\sin a \cos b \cos a \sin b)^2 = 1$.
- **43.** $(x\cos\theta y\sin\theta)^2 + (x\sin\theta + y\cos\theta)^2 = x^2 + y^2$.

44.
$$\frac{1}{(\cos^2 x - \sin^2 x)^2} - \frac{4 \tan^2 x}{(1 - \tan^2 x)^2} = 1.$$

45.
$$\frac{1}{4\sin^2 x \cos^2 x} - \frac{(1 - \tan^2 x)^2}{4\tan^2 x} = 1.$$

46.
$$(3 \sin \alpha \cos^2 \alpha - \sin^3 \alpha)^2 + (\cos^3 \alpha - 3 \sin^2 \alpha \cos \alpha)^2 = 1$$
.

47.
$$x^2 + y^2 + z^2 = r^2$$
 when

$$x = r \cos a \cos \beta + r \cos i \sin a \sin \beta$$
,

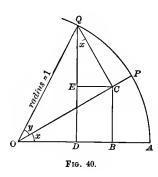

$$y = r \cos i \cos a \sin \beta - r \sin a \cos \beta$$
,

$$z = r \sin i \sin \beta$$
.

CHAPTER V.

RELATIONS BETWEEN FUNCTIONS OF SEVERAL ANGLES.

61. Sine and Cosine of the Sum of Two Angles. — Let x and y be the angles, each, as well as their sum, being less than 90°.

QC is perpendicular to OP, BC and DQ are perpendicular to OA, and EC is parallel to OA, the radius of the circle being unity. Then

$$x + y = A O Q$$

the angle EQC = x, $OC = \cos y$, and $CQ = \sin y$.

$$\sin (x + y) = DQ = BC + EQ$$

$$= OC \sin BOC + CQ \cos EQC$$

$$= \cos y \sin x + \sin y \cos x,$$

or $\sin(x+y) = \sin x \cos y + \cos x \sin y$. (1)

 $\cos(x+y) = OD = OB - EC = OC\cos BQC - CQ\sin EQC$ $= \cos y\cos x - \sin y\sin x,$

or $\cos(x+y) = \cos x \cos y - \sin x \sin y$. (2)

1. $\sin 90^{\circ} = \sin (60^{\circ} + 30^{\circ}) = \sin 60^{\circ} \cos 30^{\circ} + \cos 60^{\circ} \sin 30^{\circ}$

$$= \frac{\sqrt{3}}{2} \cdot \frac{\sqrt{3}}{2} + \frac{1}{2} \cdot \frac{1}{2} = 1.$$

2. $\cos 90^{\circ} = \cos (60^{\circ} + 30^{\circ}) = \cos 60^{\circ} \cos 30^{\circ} - \sin 60^{\circ} \sin 30^{\circ}$

$$=\frac{1}{2}\cdot\frac{\sqrt{3}}{2}-\frac{\sqrt{3}}{2}\cdot\frac{1}{2}=0.$$

3. If $\sin \alpha = \frac{3}{5}$, and $\sin \beta = \frac{5}{15}$, find $\sin (\alpha + \beta)$ and $\cos (\alpha + \beta)$ when $\alpha < 90^{\circ}$, and $\beta < 90^{\circ}$

Ans.
$$\sin (\alpha + \beta) = \frac{56}{65}$$
, $\cos (\alpha + \beta) = \frac{33}{65}$.

4. If $\tan\alpha=\frac{3}{4}$, and $\tan\beta=\frac{7}{24}$, find $\sin\left(\alpha+\beta\right)$ and $\cos\left(\alpha+\beta\right)$ when $\alpha<90^{\circ}$, and $\beta<90^{\circ}$.

Ans.
$$\sin (\alpha + \beta) = \frac{4}{5}$$
, $\cos (\alpha + \beta) = \frac{3}{5}$.

Note. — At a point A the angle of elevation DAB to the top of a vertical

wall is ω , and the angle of depression CAD to its base is β . Find the height CB of the wall, the horizontal distance AD being a feet.

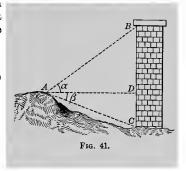

$$CB = CD + DB = a \tan \beta + a \tan \alpha$$

$$= a(\tan \alpha + \tan \beta).$$

$$= a\left(\frac{\sin \alpha}{\cos \alpha} + \frac{\sin \beta}{\cos \beta}\right)$$

$$= a\frac{\sin \alpha \cos \beta + \cos \alpha \sin \beta}{\cos \alpha \cos \beta}$$

$$= a\frac{\sin (\alpha + \beta)}{\cos \alpha \cos \beta}.$$
(4)

Eq. (3) would be solved by the use of the natural functions, while (4) is adapted to logarithmic computation.

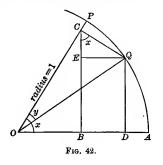

62. Sine and Cosine of the Difference of Two Angles. — Let x and y be the angles, each being less than 90° and x being

greater than y. QC is perpendicular to OP, BC and DQ are perpendicular to OA, and EQ is parallel to OA, the radius of the circle being unity. Then x-y=AOQ, ECQ=x, $OC=\cos y$, and $CQ=\sin y$.

$$\sin (x - y) = DQ = BC - EC$$

$$= OC \sin BOC - CQ \cos ECQ$$

$$= \cos y \sin x - \sin y \cos x,$$

or
$$\sin(x - y) = \sin x \cos y - \cos x \sin y.$$
 (1)

$$\cos(x - y) = OD = OB + EQ = OC \cos BOC + CQ \sin ECQ$$

$$= \cos y \cos x + \sin y \sin x,$$

or
$$\cos(x-y) = \cos x \cos y + \sin x \sin y$$
. (2)

In this proof we have assumed that x is the greater angle, but (1) and (2) are true when y is greater than x. To prove this, let β be greater than α . Then

$$\sin (\alpha - \beta) = \sin [-(\beta - \alpha)] = -\sin (\beta - \alpha),$$

CROCK, TRIG. - 5

and, developing $\sin (\beta - \alpha)$ by (1),

$$\sin (\alpha - \beta) = -(\sin \beta \cos \alpha - \cos \beta \sin \alpha)$$

$$= \sin \alpha \cos \beta - \cos \alpha \sin \beta.$$
 Q.E.D.

Also
$$\cos (\alpha - \beta) = \cos [-(\beta - \alpha)] = \cos (\beta - \alpha)$$

= $\cos \beta \cos \alpha + \sin \beta \sin \alpha$. Q.E.D.

1. $\sin 30^\circ = \sin (90^\circ - 60^\circ) = \sin 90^\circ \cos 60^\circ - \cos 90^\circ \sin 60^\circ$ $=1\cdot\frac{1}{9}-0\cdot\frac{\sqrt{3}}{9}=\frac{1}{9}$

2. $\cos 30^{\circ} = \cos (90^{\circ} - 60^{\circ}) = \cos 90^{\circ} \cos 60^{\circ} + \sin 90^{\circ} \sin 60^{\circ}$ $=0\cdot\frac{1}{9}+1\cdot\frac{\sqrt{3}}{9}=\frac{\sqrt{3}}{9}$

3. If $\sin \alpha = \frac{5}{13}$, and $\sin \beta = \frac{9}{41}$, find $\sin (\alpha - \beta)$ and $\cos (\alpha - \beta)$ when $\alpha < 90^{\circ}$, and $\beta < 90^{\circ}$. Ans. $\sin (\alpha - \beta) = \frac{92}{535}$; $\cos (\alpha - \beta) = \frac{525}{535}$.

4. If $\tan \alpha = \frac{4}{3}$, and $\tan \beta = \frac{3}{4}$, find $\sin (\alpha - \beta)$ and $\cos (\alpha - \beta)$ when $\alpha < 90^{\circ}$, and $\beta < 90.^{\circ}$ Ans. $\sin (\alpha - \beta) = \frac{7}{25}$; $\cos (\alpha - \beta) = \frac{24}{25}$.

Note. — At a point A on a horizontal plane, the angle CAD to the top of a crag is γ , and a feet farther away in the same

Fig. 43.

vertical plane (at B), the angle CBD is γ' . Find AC = x. $CD = AC \tan \gamma = x \tan \gamma$.

$$CD = AC \tan \gamma = x \tan \gamma.$$

 $CD = BC \tan \gamma' = (a + x) \tan \gamma'.$
 $\therefore x \tan \gamma = (a + x) \tan \gamma'.$

$$\therefore x = \frac{\alpha \tan \gamma'}{\tan \gamma - \tan \gamma'}.$$
 (3)

$$= \frac{a \sin \gamma' \cos \gamma}{\sin \gamma \cos \gamma' - \cos \gamma \sin \gamma'} = \frac{a \sin \gamma' \cos \gamma}{\sin (\gamma - \gamma')}.$$
 (4)

Eq. (3) would be solved by the use of the natural functions, while (4) is adapted to logarithmic computation.

63. General Proof of the Addition Formulas. - These formulas were shown in Art. 61 to be true when x, y, and x + y were each less than 90°. That they are true for all values of these angles may be shown by proving the special cases separately. Let us consider first the case when

$$x < 90^{\circ}$$
, $y < 90^{\circ}$, $x + y > 90^{\circ}$ and $< 180^{\circ}$.

Let
$$x = 90^{\circ} - \alpha$$
, $y = 90^{\circ} - \beta$; $\therefore x + y = 180^{\circ} - (\alpha + \beta)$.
 $\therefore \alpha = 90^{\circ} - x$, $\beta = 90^{\circ} - y$, $\alpha + \beta = 180^{\circ} - (x + y)$.
 $\therefore \alpha < 90^{\circ}$, $\beta < 90^{\circ}$, $\alpha + \beta < 90^{\circ}$, since $x + y > 90^{\circ}$.

Then $\sin (\alpha + \beta)$ may be developed by (1), Art. 61, since the conditions of that article are satisfied. But

$$\sin (x + y) = \sin [180^{\circ} - (\alpha + \beta)] = \sin (\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$$

$$= \sin (90^{\circ} - x) \cos (90^{\circ} - y) + \cos (90^{\circ} - x) \sin (90^{\circ} - y)$$

$$= \cos x \sin y + \sin x \cos y.$$
Q.E.D.

Also
$$\cos(x + y) = \cos[180^{\circ} - (\alpha + \beta)] = -\cos(\alpha + \beta) = -\cos\alpha\cos\beta + \sin\alpha\sin\beta$$

= $-\cos(90^{\circ} - x)\cos(90^{\circ} - y) + \sin(90^{\circ} - x)\sin(90^{\circ} - y)$
= $-\sin x \sin y + \cos x \cos y$. Q.E.D.

Hence the formulas are true for $x < 90^{\circ}$, $y < 90^{\circ}$, $x + y < 180^{\circ}$.

To illustrate the proof for any special case, let us take x in the second and y in the fourth quadrant. Place $x = 90^{\circ} + a$, and $y = 270^{\circ} + \beta$, so that a and β are each less than 90° . Then

$$\sin (x + y) = \sin [360^{\circ} + (\alpha + \beta)] = \sin (\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$$

$$= \sin (x - 90^{\circ}) \cos (y - 270^{\circ}) + \cos (x - 90^{\circ}) \sin (y - 270^{\circ})$$

$$= (-\cos x)(-\sin y) + \sin x \cos y$$

$$= \cos x \sin y + \sin x \cos y.$$
Q.E.D.

Let the student prove the addition formulas in the following cases:

- 1. x in the first, and y in the third quadrant.
- 2. x in the second, and y in the second quadrant.
- 3. x in the second, and y in the third quadrant.
- 4. x in the third, and y in the third quadrant.
- 5. x in the third, and y in the fourth quadrant.
- 6. x in the fourth, and y in the fourth quadrant.
- **64.** General Proof of the Subtraction Formulas.—These formulas were shown in Art. 62 to be true when x and y were each less than 90° , both for x > y and for x < y. That they are true for all values of the angles may be shown by proving the special cases separately. For illustration, let x be in the second, and y in the third quadrant. Place $x = 90^{\circ} + a$, and $y = 180^{\circ} + \beta$, so that $a < 90^{\circ}$, and $\beta < 90^{\circ}$. Then

$$\sin (x-y) = \sin [90^{\circ} + \alpha - (180^{\circ} + \beta)] = \sin [-90^{\circ} + (\alpha - \beta)] = -\sin [90^{\circ} - (\alpha - \beta)]$$

$$= -\cos (\alpha - \beta) = -\cos \alpha \cos \beta - \sin \alpha \sin \beta$$

$$= -\cos (x - 90^{\circ}) \cos (y - 180^{\circ}) - \sin (x - 90^{\circ}) \sin (y - 180^{\circ})$$

$$= -\sin x (-\cos y) - (-\cos x) (-\sin y)$$

$$= \sin x \cos y - \cos x \sin y.$$
Q.E.D.

Also
$$\cos (x - y) = \cos [-90^{\circ} + (\alpha - \beta)] = \cos [90^{\circ} - (\alpha - \beta)] = \sin (\alpha - \beta)$$

 $= \sin \alpha \cos \beta - \cos \alpha \sin \beta$
 $= \sin (x - 90^{\circ}) \cos (y - 180^{\circ}) - \cos (x - 90^{\circ}) \sin (y - 180^{\circ})$
 $= (-\cos x)(-\cos y) - \sin x (-\sin y)$
 $= \cos x \cos y + \sin x \sin y$. Q.E.D.

Let the student prove the subtraction formulas in the following cases:

- 1. x in the fourth, and y in the first quadrant.
- 2. x in the fourth, and y in the second quadrant.
- 3. x in the fourth, and y in the third quadrant.
- 4. x in the third, and y in the third quadrant.
- 5. x in the third, and y in the fourth quadrant.
- **6.** x in the second, and y in the fourth quadrant.

65. Tangent of the Sum and of the Difference of Two Angles.

$$\tan(x+y) = \frac{\sin(x+y)}{\cos(x+y)} = \frac{\sin x \cos y + \cos x \sin y}{\cos x \cos y - \sin x \sin y}.$$

Divide both numerator and denominator by $\cos x \cos y$.

$$\therefore \tan(x+y) = \frac{\frac{\sin x \cos y}{\cos x \cos y} + \frac{\cos x \sin y}{\cos x \cos y}}{\frac{\cos x \cos y}{\cos x \cos y} - \frac{\sin x \sin y}{\cos x \cos y}} = \frac{\frac{\sin x}{\cos x} + \frac{\sin y}{\cos y}}{1 - \frac{\sin x \sin y}{\cos x \cos y}};$$

In the same way, we may show that

$$\tan (x - y) = \frac{\tan x - \tan y}{1 + \tan x \tan y}.$$
 (2)

1.
$$\tan 75^{\circ} = \tan (45^{\circ} + 30^{\circ}) = \frac{\tan 45^{\circ} + \tan 30^{\circ}}{1 - \tan 45^{\circ} \tan 30^{\circ}} = \frac{1 + \frac{1}{\sqrt{3}}}{1 - \frac{1}{\sqrt{3}}} = \frac{\sqrt{3} + 1}{\sqrt{3} - 1} = 2 + \sqrt{3}.$$

2.
$$\tan 15^{\circ} = \tan (45^{\circ} - 30^{\circ}) = \frac{\tan 45^{\circ} - \tan 30^{\circ}}{1 + \tan 45^{\circ} \tan 30^{\circ}} = \frac{1 - \frac{1}{\sqrt{3}}}{1 + \frac{1}{\sqrt{3}}} = \frac{\sqrt{3} - 1}{\sqrt{3} + 1} = 2 - \sqrt{3}.$$

3. If $\sin \alpha = \frac{1}{1}\frac{2}{3}$ and $\sin \beta = \frac{3}{5}$, find $\tan (\alpha + \beta)$ and $\tan (\alpha - \beta)$, when $\alpha < 90^{\circ}$ and $\beta < 90^{\circ}$.

Ans. $\tan (\alpha + \beta) = -\frac{63}{16}$; $\tan (\alpha - \beta) = \frac{3}{5}\frac{3}{6}$.

66. Geometrical Proof.—In Fig. 44, let OA = 1, AOB = x, BOC = y. Draw BC perpendicular to OB, and CD parallel to OA; $\therefore DBC = x$, DCE = x + y. Then

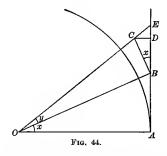

$$\tan (x + y) = AE = AB + BD + DE.$$

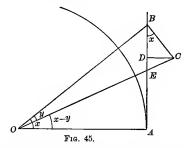

But $BD = BC \cos x = OB \tan y \cos x = \sec x \tan y \cos x = \tan y$,

and $DE = CD \tan (x + y) = BC \sin x \tan (x + y) = OB \tan y \sin x \tan (x + y)$ = $\sec x \tan y \sin x \tan (x + y) = \tan x \tan y \tan (x + y)$.

 $... \tan (x + y) = \tan x + \tan y + \tan x \tan y \tan (x + y).$

$$\therefore \tan (x+y) = \frac{\tan x + \tan y}{1 - \tan x \tan y}$$

In Fig. 45, let OA = 1, AOB = x, COB = y. Draw BC perpendicular to OB, and DC parallel to OA; ... DBC = x, DCE = x - y. Then

$$\tan (x - y) = AE = AB - DB - ED.$$

But $DB = BC \cos x = OB \tan y \cos x = \sec x \tan y \cos x = \tan y$,

and $ED = DC \tan (x - y) = BC \sin x \tan (x - y) = OB \tan y \sin x \tan (x - y)$ = $\sec x \tan y \sin x \tan (x - y) = \tan x \tan y \tan (x - y)$.

 $\therefore \tan (x-y) = \tan x - \tan y - \tan x \tan y \tan (x-y).$

$$\therefore \tan (x-y) = \frac{\tan x - \tan y}{1 + \tan x \tan y}$$

EXAMPLES.

Find by inspection one value of x in Exs. (1-6):

- 1. $\sin (n-1)\alpha \cos \alpha + \cos (n-1)\alpha \sin \alpha = \sin x$. Ans. $x = n\alpha$.
- 2. $\cos(10^{\circ} + \alpha)\cos(10^{\circ} \alpha) + \sin(10^{\circ} + \alpha)\sin(10^{\circ} \alpha) = \cos x$. Ans. $x = 2\alpha$.
- 3. $\sin (\alpha \beta + 10^{\circ}) \cos (\beta \alpha + 10^{\circ}) \cos (\alpha \beta + 10^{\circ}) \sin (\beta \alpha + 10^{\circ}) = \sin x$. Ans. $x = 2(\alpha - \beta)$.
- 4. $\cos 45^{\circ} \cos (90^{\circ} \alpha) \sin 45^{\circ} \sin (90^{\circ} \alpha) = \cos x$. Ans. $x = 135^{\circ} \alpha$.
- 5. $\sin (90^{\circ} + \frac{1}{2}\alpha) \cos (90^{\circ} \frac{1}{2}\alpha) + \cos (90^{\circ} + \frac{1}{2}\alpha) \sin (90^{\circ} \frac{1}{2}\alpha) = \sin x$. Ans. $x = 180^{\circ}$.
- 6. $\cos(45^{\circ} \alpha)\cos(45^{\circ} + \alpha) \sin(45^{\circ} \alpha)\sin(45^{\circ} + \alpha) = \cos x$. Ans. $x = 90^{\circ}$.
- 7. Given the functions of 30° and 45°, find those of 75°.

Ans.
$$\sin 75^{\circ} = \frac{\sqrt{3}+1}{2\sqrt{2}}$$
; $\cos 75^{\circ} = \frac{\sqrt{3}-1}{2\sqrt{2}}$; $\tan 75^{\circ} = \frac{\sqrt{3}+1}{\sqrt{5}-1} = 2 + \sqrt{3}$.

8. Given the functions of 30° and 45°, find those of 15°.

Ans.
$$\sin 15^{\circ} = \frac{\sqrt{3} - 1}{2\sqrt{2}}$$
; $\cos 15^{\circ} = \frac{\sqrt{3} + 1}{2\sqrt{2}}$; $\tan 15^{\circ} = 2 - \sqrt{3}$.

9. If $\tan \alpha = \frac{3}{4}$ and $\sin \beta = \frac{1}{1}\frac{2}{3}$, find the functions of $\alpha + \beta$ when α is in the third, and β in the second quadrant.

Ans.
$$\sin{(\alpha + \beta)} = -\frac{3}{6}\frac{3}{5}$$
; $\cos{(\alpha + \beta)} = \frac{5}{6}\frac{6}{5}$; $\tan{(\alpha + \beta)} = -\frac{3}{5}\frac{3}{6}$.

10. If $\cos \alpha = -\frac{40}{41}$ and $\sin \beta = -\frac{5}{13}$, find the functions of $\alpha - \beta$ when α is in the third, and β in the fourth quadrant.

Ans.
$$\sin (\alpha - \beta) = -\frac{308}{533}$$
; $\cos (\alpha - \beta) = -\frac{435}{533}$; $\tan (\alpha - \beta) = +\frac{308}{435}$.

11. If $\cos \alpha = \frac{3}{5}$ and $\sin \beta = -\frac{3}{5}$, find the functions of $\alpha + \beta$ and of $\alpha - \beta$ when α is in the fourth, and β in the third quadrant.

Ans.
$$\sin (\alpha + \beta) = +\frac{7}{25}$$
; $\cos (\alpha + \beta) = -\frac{24}{25}$; $\tan (\alpha + \beta) = -\frac{7}{24}$; $\sin (\alpha - \beta) = +1$; $\cos (\alpha - \beta) = 0$; $\tan (\alpha - \beta) = \infty$.

Transform the first member into the second (or last) in Exs. (12-32):

- 12. $\sin(\alpha + \beta) \sin(\alpha \beta) = \sin^2 \alpha \sin^2 \beta = \cos^2 \beta \cos^2 \alpha$.
- 13. $\cos(\alpha + \beta)\cos(\alpha \beta) = \cos^2\alpha \sin^2\beta = \cos^2\beta \sin^2\alpha$.
- 14. $\sin (60^{\circ} + \alpha) \sin \alpha = \sin (60^{\circ} \alpha)$.
- 15. $(r'\cos v' r\cos v)^2 + (r'\sin v' r\sin v)^2 = r^2 + r'^2 2rr'\cos(v' v)$
- 16. $\cos^2 \alpha + \cos^2 \beta 2 \cos \alpha \cos \beta \cos \omega = \sin^2 \omega$, when $\omega = \alpha + \beta$. [Place $\alpha = \omega \beta$.]
 - 17. $\tan \alpha + \frac{\tan \phi \sec \alpha}{\cos \alpha \tan \phi \sin \alpha} = \tan (\alpha + \phi)$.
 - 18. $\sin^2 \theta + \sin^2 (\omega \theta) + 2 \sin \theta \cos \omega \sin (\omega \theta) = \sin^2 \omega$.
 - 19. $\cos^2\theta + \cos^2(\omega \theta) 2\cos\theta\cos\omega\cos(\omega \theta) = \sin^2\omega$.
 - 20. $\tan x \pm \tan y = \frac{\sin (x \pm y)}{\cos x \cos y}$.
 - 21. $\cot x \pm \cot y = \frac{\sin (y \pm x)}{\sin x \sin y}$.
 - 22. $\cot x \pm \tan y = \frac{\cos (x \mp y)}{\sin x \cos y}$
 - 23. $\tan (30^{\circ} + x) + \tan (30^{\circ} x) = \sin 60^{\circ} \sec (30^{\circ} + x) \sec (30^{\circ} x)$.

۸.

- 24. $\frac{1-\tan \alpha}{1+\tan \alpha} = \tan (45^{\circ} \alpha)$. [Note that $1 = \tan 45^{\circ}$.]
- 25. $\frac{1-\cot a}{1+\cot a} = -\tan (45^{\circ} a)$. [Note that $1 = \cot 45^{\circ}$.]
- 26. $\sin (60^{\circ} + a) \sin (60^{\circ} a) = \sin a$.
- 27. $\tan (45^{\circ} + \alpha) \tan (45^{\circ} \alpha) = \frac{4 \tan \alpha}{1 \tan^2 \alpha}$
- 28. $\frac{\sin (x+y)}{\cos (x-y)} = \frac{\tan x + \tan y}{1 + \tan x \tan y} = \frac{\cot x + \cot y}{1 + \cot x \cot y}$

- 29. $\sin(a+b+c) = \sin[(a+b)+c] = \sin(a+b)\cos c + \cos(a+b)\sin c$ = $(\sin a \cos b + \cos a \sin b)\cos c + (\cos a \cos b - \sin a \sin b)\sin c$ = $\sin a \cos b \cos c + \cos a \sin b \cos c + \cos a \cos b \sin c - \sin a \sin b \sin c$.
- 30. $\cos(a+b+c) = \cos a \cos b \cos c \sin a \sin b \cos c \sin a \cos b \sin c$ $-\cos a \sin b \sin c$
- 31. $\tan(a+b+c) = \frac{\tan a + \tan b + \tan c \tan a \tan b \tan c}{1 \tan a \tan b \tan a \tan c \tan b \tan c}$
- 32. $\sin(a+b-c) = \sin a \cos b \cos c + \cos a \sin b \cos c \cos a \cos b \sin c$
- 33. If $\sin \alpha = \frac{3}{5}$, $\sin \beta = -\frac{1}{1\frac{2}{5}}$, $\sin \gamma = -\frac{3}{5}$, find $\sin (\alpha \beta \gamma)$, when α, β , and γ are in the second, third, and fourth quadrants respectively. Ans. $-\frac{1}{5}$?
- 34. If $\sin \alpha = \frac{3}{5}$, $\cos \beta = \frac{4}{5}$, $\tan \gamma = \frac{3}{4}$, find $\cos (\alpha \beta + \gamma)$, when α , β , and γ are in the second, fourth, and third quadrants respectively.

 Ans. $+\frac{4}{5}$.
- 67. To express the Functions of an Angle in Terms of those of Half the Angle. In (1) and (2), Art. 61, let y = x.
 - $\cdot \cdot \cdot \sin 2x = \sin x \cos x + \cos x \sin x = 2 \sin x \cos x.$ (1)

$$\cos 2x = \cos^2 x - \sin^2 x,\tag{2}$$

$$\cos 2x = 1 - \sin^2 x - \sin^2 x = 1 - 2\sin^2 x, \tag{3}$$

From (1), Art. 65,

or

$$\cos 2x = \cos^2 x - 1 + \cos^2 x = 2\cos^2 x - 1. \tag{4}$$

$$\tan 2x = \frac{\tan x + \tan x}{1 - \tan x \tan x} = \frac{2 \tan x}{1 - \tan^2 x}.$$
 (5)

1. To express the functions of 40° in terms of those of 20°, we have

$$\begin{split} \sin 40^\circ &= 2 \sin 20^\circ \cos 20^\circ \,; \\ \cos 40^\circ &= \cos^2 20^\circ - \sin^2 20^\circ \,; \\ \tan 40^\circ &= \frac{2 \tan 20^\circ}{1 - \tan^2 20^\circ}. \end{split}$$

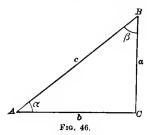

- 2. $\sin \theta = \frac{2}{\sqrt{5}}$, θ being in the second quadrant. Find $\sin 2\theta$, $\cos 2\theta$, $\tan 2\theta$.

 Ans. $\sin 2\theta = -\frac{4}{5}$; $\cos 2\theta = -\frac{2}{5}$; $\tan 2\theta = +\frac{4}{5}$.
- 3. $\tan \theta = +2$, θ being in the third quadrant. Find $\sin 2\theta$, $\cos 2\theta$, $\tan 2\theta$.

 Ans. $\sin 2\theta = +\frac{4}{3}$; $\cos 2\theta = -\frac{3}{3}$; $\tan 2\theta = -\frac{4}{3}$.
- 4. $\cot \theta = -\frac{3}{4}$, θ being in the fourth quadrant. Find $\sin 2\theta$, $\cos 2\theta$, $\tan 2\theta$.

 Ans. $\sin 2\theta = -\frac{24}{25}$; $\cos 2\theta = -\frac{7}{25}$; $\tan 2\theta = +\frac{24}{7}$.

Note. — To find the area of a right triangle, given c and a, we have

area =
$$\frac{1}{2} \alpha b$$
.

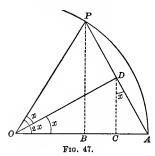

But $a = c \sin a$, and $b = c \cos a$.

$$\therefore \text{ area} = \frac{1}{2} c^2 \sin \alpha \cos \alpha; \qquad (6)$$

... area =
$$\frac{1}{4} c^2 \sin 2 \alpha$$
. (7)

In (6) we should have to find both $\sin \alpha$ and $\cos \alpha$ from the tables, in (7) we find only $\sin 2\alpha$, so that time is saved by using (7) instead of (6).

68. Geometrical Proof. — Let the radius OA of the circle be unity.

$$\sin 2 x = BP = 2 CD = 2 OD \sin x$$
$$= 2 OA \cos x \sin x.$$

$$\cos 2 x = OB = OC - BC = OC - CA$$

$$= OD \cos x - AD \sin x$$

$$= OA \cos^2 x - OA \sin^2 x$$

$$= OA (\cos^2 x - \sin^2 x).$$

$$\tan 2x = \frac{BP}{OB} = \frac{2CD}{OC - CA} = \frac{2OC \tan x}{OC - CD \tan x}$$
$$= \frac{2OC \tan x}{OC - OC \tan^2 x} = \frac{2\tan x}{1 - \tan^2 x}.$$

(2)

69. To express the Functions of an Angle in Terms of those of Double the Angle. — From Art. 67,

$$\cos 2x = 1 - 2\sin^2 x;$$

 $\therefore 2\sin^2 x = 1 - \cos 2x.$ (1)

Also

$$\cos 2x = 2\cos^2 x - 1$$
;
 $\therefore 2\cos^2 x = 1 + \cos 2x$.

From (1) and (2),
$$\tan^2 x = \frac{1 - \cos 2 x}{1 + \cos 2 x}$$
 (3)

$$\therefore \tan x = \pm \sqrt{\frac{1 - \cos 2x}{1 + \cos 2x}}.$$
 (4)

$$\therefore \tan x = \sqrt{\frac{1 - \cos 2x}{1 + \cos 2x}} \cdot \frac{1 + \cos 2x}{1 + \cos 2x} = \sqrt{\frac{1 - \cos^2 2x}{(1 + \cos 2x)^2}};$$

$$\therefore \tan x = \frac{\sin 2x}{1 + \cos 2x} \tag{5}$$

Also
$$\tan x = \sqrt{\frac{1 - \cos 2x}{1 + \cos 2x}} \cdot \frac{1 - \cos 2x}{1 - \cos 2x} = \sqrt{\frac{(1 - \cos 2x)^2}{1 - \cos^2 2x}};$$

$$\therefore \tan x = \frac{1 - \cos 2x}{\sin 2x} \tag{6}$$

Note. — The double sign is not used in (5) and (6), for

$$\frac{\sin 2x}{1+\cos 2x} = \frac{2\sin x \cos x}{2\cos^2 x} = \tan x,$$

$$\frac{1-\cos 2x}{\sin 2x} = \frac{2\sin^2 x}{2\sin x \cos x} = \tan x.$$

and

1. To express the functions of 20° in terms of those of 40°, we have

$$2 \sin^{2} 20^{\circ} = 1 - \cos 40^{\circ};$$

$$2 \cos^{2} 20^{\circ} = 1 + \cos 40^{\circ};$$

$$\tan^{2} 20^{\circ} = \frac{1 - \cos 40^{\circ}}{1 + \cos 40^{\circ}};$$

$$\tan 20^{\circ} = \frac{\sin 40^{\circ}}{1 + \cos 40^{\circ}} = \frac{1 - \cos 40^{\circ}}{\sin 40^{\circ}}.$$

2. $\tan 2\theta = -2$, 2θ being in the second quadrant. Find the functions of θ .

$$\therefore \cos 2 \theta = -\frac{1}{\sqrt{5}}, \text{ and } \sin 2 \theta = +\frac{2}{\sqrt{5}}$$

$$\therefore \sin \theta = \pm \sqrt{\frac{1}{2} \left(1 + \frac{1}{\sqrt{5}}\right)}, \text{ from } (1);$$

$$\cos \theta = \pm \sqrt{\frac{1}{2} \left(1 - \frac{1}{\sqrt{5}}\right)}, \text{ from } (2);$$

$$\tan \theta = \frac{\frac{2}{\sqrt{5}}}{1 - \frac{1}{\sqrt{5}}} = \frac{2}{\sqrt{5} - 1}, \text{ from } (5).$$

Since 2θ is in the second quadrant, θ may be either in the first or in the third quadrant; hence $\sin \theta$ and $\cos \theta$ have the double sign, and $\tan \theta$ is positive.

3. Given the functions of 30°, find those of 15°.

Ans.
$$\sin 15^\circ = \frac{\sqrt{3} - 1}{2\sqrt{2}}$$
; $\cos 15^\circ = \frac{\sqrt{3} + 1}{2\sqrt{2}}$; $\tan 15^\circ = 2 - \sqrt{3}$.

4. Given the functions of 45°, find those of 22½°.

Ans.
$$\sin 22\frac{1}{2}^{\circ} = \frac{1}{2}\sqrt{2-\sqrt{2}}$$
; $\cos 22\frac{1}{2}^{\circ} = \frac{1}{2}\sqrt{2+\sqrt{2}}$; $\tan 22\frac{1}{2}^{\circ} = \sqrt{2}-1$.

70. Geometrical Proof. — Let the radius CA of the circle be unity.

$$\sin x = \frac{BP}{OP} = \frac{\sqrt{OB \cdot BA}}{\sqrt{OB \cdot OA}} = \sqrt{\frac{BA}{OA}} = \sqrt{\frac{BA}{2}}$$

$$= \sqrt{\frac{CA - CB}{2}} = \sqrt{\frac{1 - \cos 2x}{2}}.$$

$$\cos x = \frac{OB}{OP} = \frac{OB}{\sqrt{OB \cdot OA}} = \sqrt{\frac{OB}{OA}} = \sqrt{\frac{OB}{2}}$$

$$= \sqrt{\frac{OC + CB}{2}} = \sqrt{\frac{1 + \cos 2x}{2}}.$$
Fig. 48.

$$\tan x = \frac{BP}{OB} = \frac{BP}{OC + CB} = \frac{\sin 2x}{1 + \cos 2x}$$

$$\tan x = \frac{BA}{BP} = \frac{CA - CB}{BP} = \frac{1 - \cos 2x}{\sin 2x}$$

71. Multiple Angles. - Suppose that we wish to express $\sin 3x$ in terms of powers of $\sin x$.

$$\sin 3 x = \sin (2x + x) = \sin 2 x \cos x + \cos 2 x \sin x$$

$$= 2 \sin x \cos^2 x + (1 - 2 \sin^2 x) \sin x$$

$$= 2 \sin x - 2 \sin^3 x + \sin x - 2 \sin^3 x$$

$$= 3 \sin x - 4 \sin^3 x.$$
 Q.E.I.

- 1. Show that $\cos 3x = 4\cos^3 x 3\cos x$.
- 2. Show that $\tan 3x = \frac{3 \tan x \tan^3 x}{1 3 \tan^2 x}$
- 3. Show that $\sin 4x = 4\sin x \cos x 8\sin^3 x \cos x$. [Use 4x = 2x + 2x.]
- 4. Show that $\cos 4x = 1 8\sin^2 x + 8\sin^4 x$.
- 5. Show that $\tan 4x = \frac{4 \tan x (1 \tan^2 x)}{1 6 \tan^2 x + \tan^4 x}$
- 6. Show that $\sin 5x = 5\sin x 20\sin^3 x + 16\sin^5 x$. [Use 5x = 3x + 2x.]
- 7. Show that $\cos 5x = 5\cos x 20\cos^8 x + 16\cos^5 x$.
- 8. Find the functions of 18°, of 36°, and of 72°.

Place $x = 18^{\circ}$; then, since $\cos 54^{\circ} = \sin 36^{\circ}$, we have

$$\cos 3x = \sin 2x$$
.

$$\therefore 4\cos^3 x - 3\cos x = 2\sin x\cos x.$$

$$\therefore \cos x \left(4\cos^2 x - 3 - 2\sin x \right) = 0.$$

$$\therefore 1 - 4\sin^2 x - 2\sin x = 0.$$

$$\therefore \sin x = \frac{1}{4}(-1 \pm \sqrt{5}).$$

$$\therefore \sin 18^\circ = \cos 72^\circ = \frac{1}{4}(\sqrt{5} - 1); \cos 18^\circ = \sin 72^\circ = \frac{1}{4}\sqrt{10 + 2\sqrt{5}}.$$

Hence

$$\sin 36^{\circ} = 2\sin 18^{\circ}\cos 18^{\circ} = \frac{1}{4}\sqrt{10 - 2\sqrt{5}};$$
$$\cos 36^{\circ} = 1 - 2\sin^2 18^{\circ} = \frac{1}{4}(\sqrt{5} + 1).$$

72. To change the Product of Functions of Angles into the Sum of Functions. — From Arts. 61 and 62,

$$\sin(x+y) = \sin x \cos y + \cos x \sin y;$$

$$\sin(x-y) = \sin x \cos y - \cos x \sin y.$$

$$\therefore \sin(x+y) + \sin(x-y) = 2\sin^{2} x \cos y,$$

$$\sin(x+y) = \sin(x-y) = 2\cos x \sin y.$$
(2)

 $\sin(x+y) - \sin(x-y) = 2\cos x \sin y.$ and (2)

$$\cos(x+y) = \cos x \cos y - \sin x \sin y;$$

$$\cos(x-y) = \cos x \cos y + \sin x \sin y.$$

$$\therefore \cos(x+y) + \cos(x-y) = 2\cos x \cos y, \tag{3}$$

and

$$\cos(x+y) - \cos(x-y) = -2\sin x \sin y. \tag{4}$$

Reversing (1), (2), (3), and (4), we have

$$\sin x \cos y = \frac{1}{2} \sin (x + y) + \frac{1}{2} \sin (x - y).$$
 (5)

$$\cos x \sin y = \frac{1}{2} \sin (x + y) - \frac{1}{2} \sin (x - y).$$
 (6)

$$\cos x \cos y = \frac{1}{2}\cos(x+y) + \frac{1}{2}\cos(x-y). \tag{7}$$

$$\sin x \sin y = -\frac{1}{2}\cos(x+y) + \frac{1}{2}\cos(x-y).$$
 (8)

In applying these formulas, let x represent the larger angle.

1.
$$\sin 4\theta \cos 2\theta = \frac{1}{2} \sin (4\theta + 2\theta) + \frac{1}{2} \sin (4\theta - 2\theta)$$
, from (5),
= $\frac{1}{2} \sin 6\theta + \frac{1}{2} \sin 2\theta$.

2.
$$\cos 6 \theta \sin 2 \theta = \frac{1}{2} \sin (6 \theta + 2 \theta) - \frac{1}{2} \sin (6 \theta - 2 \theta)$$
, from (6),
= $\frac{1}{2} \sin 8 \theta - \frac{1}{2} \sin 4 \theta$.

3.
$$\cos 8\theta \cos 2\theta = \frac{1}{2}\cos 10\theta + \frac{1}{2}\cos 6\theta$$
, from (7).

4.
$$\sin 6 \theta \sin 4 \theta = -\frac{1}{2} \cos 10 \theta + \frac{1}{2} \cos 2 \theta$$
, from (8).

5.
$$\cos 2\theta \sin 4\theta = \frac{1}{2}\sin 6\theta - \frac{1}{2}\sin (-2\theta)$$
, from (6),
= $\frac{1}{2}\sin 6\theta + \frac{1}{2}\sin 2\theta$, as in Ex. 1.

6.
$$\sin 2\theta \cos 6\theta = \frac{1}{2}\sin 8\theta + \frac{1}{2}\sin (-4\theta)$$
, from (5),
= $\frac{1}{2}\sin 8\theta - \frac{1}{2}\sin 4\theta$, as in Ex. 2.

7.
$$\cos 2\theta \cos 8\theta = \frac{1}{2}\cos 10\theta + \frac{1}{2}\cos (-6\theta)$$
, from (7),
= $\frac{1}{2}\cos 10\theta + \frac{1}{2}\cos 6\theta$, as in Ex. 3.

8.
$$\sin 4\theta \sin 6\theta = -\frac{1}{2}\cos 10\theta + \frac{1}{2}\cos (-2\theta)$$
, from (8),
= $-\frac{1}{2}\cos 10\theta + \frac{1}{2}\cos 2\theta$, as in Ex. 4.

9.
$$\sin^2 \theta \cos \theta = \sin \theta \left[\sin \theta \cos \theta \right] = \sin \theta \left[\frac{1}{2} \sin (\theta + \theta) + \frac{1}{2} \sin (\theta - \theta) \right]$$

 $= \sin \theta \left[\frac{1}{2} \sin 2 \theta + \frac{1}{2} \sin 0^{\circ} \right] = \frac{1}{2} \sin \theta \sin 2 \theta$
 $= \frac{1}{2} \left[-\frac{1}{2} \cos 3 \theta + \frac{1}{2} \cos \theta \right] = -\frac{1}{4} \cos 3 \theta + \frac{1}{4} \cos \theta.$

10. Reduce $\sin^8 \alpha \cos \alpha$ to $\frac{1}{4} \sin 2 \alpha - \frac{1}{8} \sin 4 \alpha$.

$$\sin^8 \alpha \cos \alpha = \sin^2 \alpha \cdot \sin \alpha \cos \alpha$$
;

using (8) and (5), or the relations in Arts. 69 and 67, we have

$$\sin^{3} \alpha \cos \alpha = \frac{1}{2} (1 - \cos 2 \alpha) \cdot \frac{1}{2} \sin 2 \alpha = \frac{1}{4} \sin 2 \alpha - \frac{1}{4} \sin 2 \alpha \cos 2 \alpha$$
$$= \frac{1}{4} \sin 2 \alpha - \frac{1}{8} \sin 4 \alpha.$$

- 11. Reduce $\sin^2\theta\cos^2\theta$ to $\frac{1}{8}(1-\cos 4\theta)$.
- 12. Reduce $\sin^2\theta \cos^3\theta$ to $\frac{1}{8}(\cos\theta \frac{1}{2}\cos 3\theta \frac{1}{2}\cos 5\theta)$.
- 13. Reduce $\sin^3\theta \cos^3\theta$ to $\frac{1}{2}$ $(3\sin 2\theta \sin 6\theta)$.
- 14. Reduce $\cos^5 \theta$ to $\frac{1}{15}$ (10 $\cos \theta + 5 \cos 3 \theta + \cos 5 \theta$).
- 15. Reduce $\cos^8 \theta$ to $\frac{1}{4} (\cos 3 \theta + 3 \cos \theta)$.
- 16. Reduce $\sin^5\theta\cos^8\theta$ to $\frac{1}{64}(3\sin 2\theta \sin 4\theta \sin 6\theta + \frac{1}{2}\sin 8\theta)$.

73. To change the Algebraic Sum of Functions of Angles into the Product of Functions. — Let x + y = u and (x - y) = v.

$$\therefore x = \frac{1}{2}(u+v) \text{ and } y = \frac{1}{2}(u-v).$$

Substituting in (1), (2), (3), and (4), Art. 72, we have

$$\sin u + \sin v = 2\sin\frac{1}{2}(u+v)\cos\frac{1}{2}(u-v). \tag{1}$$

$$\sin u - \sin v = 2\cos\frac{1}{2}(u+v)\sin\frac{1}{2}(u-v). \tag{2}$$

$$\cos u + \cos v = 2\cos\frac{1}{2}(u+v)\cos\frac{1}{2}(u-v). \tag{3}$$

$$\cos u - \cos v = -2\sin\frac{1}{2}(u+v)\sin\frac{1}{2}(u-v). \tag{4}$$

In applying the formulas, let u represent the larger angle.

- 1. Reduce $\sin 3\theta + \sin \theta$ to $2 \sin 2\theta \cos \theta$. Let $u = 3\theta$ and $v = \theta$ in (1).
- 2. Reduce $\cos \theta \cos 3\theta$ to $4 \sin^2 \theta \cos \theta$.

$$\cos \theta - \cos 3 \theta = -(\cos 3 \theta - \cos \theta)$$
. Let $u = 3 \theta$ and $v = \theta$ in (4).

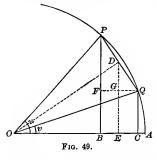

$$\therefore -(\cos 3 \theta - \cos \theta) = -(-2 \sin 2 \theta \sin \theta) = +2 \sin 2 \theta \sin \theta$$

$$= 4 \sin \theta \cos \theta \sin \theta = 4 \sin^2 \theta \cos \theta.$$

3. Reduce $\sin 3\theta + \cos \theta$ to a product.

$$\sin 3 \theta + \cos \theta = \sin 3 \theta + \sin (90^{\circ} - \theta) = 2 \sin (45^{\circ} + \theta) \cos (2 \theta - 45^{\circ})$$
$$= 2 \sin (45^{\circ} + \theta) \cos (45^{\circ} - 2 \theta).$$

74. Geometrical Proof.—In the figure, OD bisects the angle QOP, and is therefore perpendicular to QP. Using the notation there shown, we have

$$QOP = u - v$$
; ... $QOD = DOP = \frac{1}{2}(u - v)$; $AOD = AOQ + QOD = v + \frac{1}{2}(u - v) = \frac{1}{2}(u + v)$; $FPQ = GDQ = AOD = \frac{1}{2}(u + v)$. Then, if the radius = I,

$$\sin u + \sin v = BP + CQ = 2 ED = 2 OD \sin AOD$$

= $2 OP \cos DOP \sin AOD$
= $2 \sin \frac{1}{2} (u+v) \cos \frac{1}{2} (u-v)$. (1)

$$\sin u - \sin v = BP - CQ = 2 GD = 2 DQ \cos GDQ$$

= $2 OQ \sin QOD \cos GDQ$
= $2 \cos \frac{1}{2} (u+v) \sin \frac{1}{2} (u-v)$. (2)

$$\cos u + \cos v = OB + OC = 2 OE = 2 OD \cos AOD = 2 OP \cos DOP \cos AOD$$

$$= 2 \cos \frac{1}{2} (u + v) \cos \frac{1}{2} (u - v).$$
(3)

$$\cos u - \cos v = OB - OC = -2 GQ = -2 DQ \sin GDQ = -2 OQ \sin QOD \sin GDQ$$

$$= -2 \sin \frac{1}{2} (u + v) \sin \frac{1}{2} (u - v). \tag{4}$$

EXAMPLES.

Show that the first member of the equation may be reduced to the second (or last) in Exs. (1-7):

- 1. $\sin (45^{\circ} + x) + \sin (45^{\circ} x) = 2 \sin 45^{\circ} \cos x = \sqrt{2} \cos x$.
- 2. $\sin (90^{\circ} + x) \sin (180^{\circ} + x) = 2 \cos (135^{\circ} + x) \sin (-45^{\circ})$ = $-\sqrt{2} \cos (135^{\circ} + x)$.
- 3. $\cos (180^{\circ} + x) + \cos (180^{\circ} x) = 2 \cos 180^{\circ} \cos x = -2 \cos x$.
- 4. $\cos(270^{\circ} + x) \cos(270^{\circ} x) = -2\sin 270^{\circ} \sin x = +2\sin x$.
 - 5. $\sin 3x + 2\sin 5x + \sin 7x = 4\sin 5x\cos^2 x$.
 - 6. $\cos 3x + 2\cos 5x + \cos 7x = 4\cos 5x\cos^2 x$.
 - 7. $\cos(b-c)-\cos a=+2\sin\frac{1}{2}(a+b-c)\sin\frac{1}{2}(a-b+c)$.
- 8. Show that $\sin(\lambda''-\lambda')-\sin(\lambda''-\lambda)+\sin(\lambda'-\lambda)$ may be reduced to $4\sin\frac{1}{2}(\lambda'-\lambda)\sin\frac{1}{2}(\lambda''-\lambda')\sin\frac{1}{2}(\lambda''-\lambda)$. [The formula $\sin x=2\sin\frac{1}{2}x\cos\frac{1}{2}x$ is used in the process.]

If $a+\beta+\gamma=180^{\circ}$, reduce the first member to the second in Exs. (9-14):

- 9. $\sin \alpha + \sin \beta + \sin \gamma = 4 \sin \frac{1}{2} (\alpha + \beta) \cos \frac{1}{2} \alpha \cos \frac{1}{2} \beta$.
 - $\gamma = 180^{\circ} (\alpha + \beta); \quad \sin \gamma = \sin (\alpha + \beta).$ Then

 $\sin \alpha + \sin \beta + \sin (\alpha + \beta) = 2 \sin \frac{1}{2} (\alpha + \beta) \cos \frac{1}{2} (\alpha - \beta) + 2 \sin \frac{1}{2} (\alpha + \beta) \cos \frac{1}{2} (\alpha + \beta)$ $= 2 \sin \frac{1}{2} (\alpha + \beta) [\cos \frac{1}{2} (\alpha - \beta) + \cos \frac{1}{2} (\alpha + \beta)]$ $= 2 \sin \frac{1}{2} (\alpha + \beta) (2 \cos \frac{1}{2} \alpha \cos \frac{1}{2} \beta).$

- 10. $\cos \alpha + \cos \beta + \cos \gamma = 4 \cos \frac{1}{2} (\alpha + \beta) \sin \frac{1}{2} \alpha \sin \frac{1}{2} \beta + 1$. [Note that $\cos \gamma = -\cos (\alpha + \beta) = -2 \cos^2 \frac{1}{2} (\alpha + \beta) + 1$.]
 - 11. $\cos 2\alpha + \cos 2\beta + \cos 2\gamma = -4\cos \alpha\cos \beta\cos \gamma 1$.
 - 12. $\sin 2\alpha + \sin 2\beta + \sin 2\gamma = 4 \sin \alpha \sin \beta \sin \gamma$.
 - 13. $2 \sin^2 \alpha + 2 \sin^2 \beta + 2 \sin^2 \gamma = 4 + 4 \cos \alpha \cos \beta \cos \gamma$.
 - 14. $\sin 3 \alpha + \sin 3 \beta + \sin 3 \gamma = -4 \cos \frac{3}{2} \alpha \cos \frac{3}{2} \beta \cos \frac{3}{2} \gamma$.
 - 15. If $\alpha + \beta + \gamma = 360^{\circ}$, $\sin \alpha + \sin \beta + \sin \gamma = 4 \sin \frac{1}{2} \alpha \sin \frac{1}{2} \beta \sin \frac{1}{2} \gamma$.
 - 16. If $\alpha + \beta + \gamma = 360^{\circ}$, $\sin \alpha + \sin \beta + 2 \sin \frac{1}{2} \gamma = 4 \sin \frac{1}{2} (\alpha + \beta) \cos^2 \frac{1}{4} (\alpha \beta)$.
- 75. Circular, or Inverse Trigonometric, Functions. If y is the sine of the angle or arc x, then x is the arc whose

sine is y. This is written $x = \sin^{-1} y$, read "x is the arc whose sine is y." So also if $\tan x = m$, then "x is the arc whose tangent is m," written $x = \tan^{-1} m$.

In consequence of this notation, if we have

 $\frac{1}{\sin x}$ and wish to bring $\sin x$ into the numer-

Fig. 50.

ator, we must write it in a parenthesis with the exponent -1;

 $\frac{1}{\sin x} = (\sin x)^{-1}$. All other exponents may be written above the name of the functions; $\frac{1}{\sin^2 x} = \sin^{-2} x = (\sin x)^{-2}$.

1. $y = \tan^{-1} m + \tan^{-1} n$. Find $\tan y$.

Let $\tan^{-1} m = a$ and $\tan^{-1} n = b$; $\therefore \tan a = m$, $\tan b = n$.

$$y = a + b$$
; $\tan y = \frac{\tan a + \tan b}{1 - \tan a \tan b} = \frac{m + n}{1 - mn}$

2.
$$\tan^{-1}\frac{1}{m} = \tan^{-1}\frac{1}{m+n} + \tan^{-1}x$$
. Find x.

$$\therefore \tan^{-1} x = \tan^{-1} \frac{1}{m} - \tan^{-1} \frac{1}{m+n}$$
 Let $a = \tan^{-1} \frac{1}{m}$, $b = \tan^{-1} \frac{1}{m+n}$

$$\therefore \tan^{-1} x = a - b \; ; \; \therefore \; x = \tan (a - b) = \frac{\tan a - \tan b}{1 + \tan a \tan b} = \frac{\frac{1}{m} - \frac{1}{m + n}}{1 + \frac{1}{m(m + n)}}$$

$$\therefore \; x = \frac{n}{m^2 + mn + 1}$$

3.*
$$y = \sin^{-1} \frac{1}{2} + \tan^{-1} \frac{3}{4}$$
. Find $\sin y$. Ans. $\sin y = \frac{1}{10} (4 + 3\sqrt{3})$.

4.
$$\tan^{-1}\frac{1}{m} = \tan^{-1}\frac{1}{m-n} - \tan^{-1}x$$
. Find $x = \frac{n}{m^2 - mn + 1}$.

5.
$$\tan^{-1} a = \tan^{-1} \frac{1}{4} + \tan^{-1} \frac{1}{13}$$
. Find $a = \frac{1}{3}$.

6.*
$$y = \sin^{-1} m + \sin^{-1} n$$
. Find $\sin y = m\sqrt{1 - n^2} + n\sqrt{1 - m^2}$.

7.*
$$y = \cos^{-1} m + \cos^{-1} n$$
. Find $\sin y = n\sqrt{1 - m^2} + m\sqrt{1 - n^2}$.

8.*
$$y = \cos^{-1} m - \sin^{-1} n$$
. Find $\cos y = m\sqrt{1 - n^2} + n\sqrt{1 - m^2}$.

9.
$$\tan^{-1} a = \tan^{-1} \frac{1}{2} - \tan^{-1} \frac{1}{7}$$
. Find $a = \frac{1}{3}$

10.*
$$m = \tan^{-1} \frac{1}{2} + \tan^{-1} \frac{1}{3}$$
. Find $m = 45^{\circ}$.

11.*
$$m = \tan^{-1} \frac{1}{2} + \tan^{-1} \frac{1}{4} + \tan^{-1} \frac{1}{13}$$
. Find $m = 45^{\circ}$.

12.*
$$m = 2 \tan^{-1} \frac{1}{2} - \tan^{-1} \frac{1}{7}$$
. Find $m = 45^{\circ}$.

Let $\tan^{-1} \frac{1}{2} = a$, $\tan^{-1} \frac{1}{7} = b$; ... m = 2 a + b; ... $\tan m =$, etc.

13.*
$$m = 2 \tan^{-1} \frac{1}{3} + \tan^{-1} \frac{1}{7}$$
. Find $m = 45^{\circ}$.

14.* Show that
$$\tan^{-1} \frac{1}{2} (1-m) = \sec^{-1} \frac{1}{2} \sqrt{5-2m+m^2}$$
.

Let
$$\tan^{-1}\frac{1}{2}(1-m) = x$$
; $\tan x = \frac{1}{2}(1-m)$; $\sec x = \sqrt{1+\tan^2 x}$;
 $\therefore \sec x = \frac{1}{2}\sqrt{5-2m+m^2}$. $\therefore x = \sec^{-1}\frac{1}{2}\sqrt{5-2m+m^2}$.

15. Show that
$$\tan^{-1} m = \frac{1}{2} \tan^{-1} \frac{2 m}{1 - m^2}$$

Let $x = \tan^{-1} m$, or $m = \tan x$. If the equation is true, we must have

$$x = \frac{1}{2} \tan^{-1} \frac{2 m}{1 - m^2}$$
, or $2 x = \tan^{-1} \frac{2 \tan x}{1 - \tan^2 x}$, or $\tan 2 x = \frac{2 \tan x}{1 - \tan^2 x}$,

a formula proved in Art. 67.

16. Show that
$$\cos^{-1} m = \frac{1}{2} \cos^{-1} (2 m^2 - 1)$$
.

17.* Show that
$$\sin^{-1}\frac{2\sqrt{ab}}{a+b} = \tan^{-1}\frac{2\sqrt{ab}}{a-b}$$

^{*} When the angles are less than 90°.

18. Show that
$$\sin\left(\frac{\pi}{2}-2\tan^{-1}\sqrt{\frac{1-x}{1+x}}\right)=x$$
.

19.* Show that $\frac{1}{2}$ vers⁻¹ $\frac{1}{2}$ $a^2 - \sin^{-1}\frac{1}{2}$ a is constant for all possible values of a.

Let $\theta = \frac{1}{2} \text{ vers}^{-1} \frac{1}{2} a^2 - \sin^{-1} \frac{1}{2} a$, and let $m = \text{vers}^{-1} \frac{1}{2} a^2$, $n = \sin^{-1} \frac{1}{2} a$.

... $\theta = \frac{1}{2} m - n$; ... $2 \theta = m - 2 n$; ... $\cos 2 \theta = \cos m \cos 2 n + \sin m \sin 2 n$.

But $\sin n = \frac{1}{2} a$; $\therefore \cos n = \frac{1}{2} \sqrt{4 - a^2}$;

$$\therefore \sin 2 n = \frac{1}{2} a \sqrt{4 - a^2}; \cos 2 n = \frac{1}{2} (2 - a^2).$$

Also $\cos m = 1 - \text{vers } m = 1 - \frac{1}{2} a^2$; $\therefore \sin m = \frac{a}{2} \sqrt{4 - a^2}$.

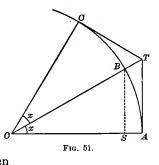

$$\therefore \cos 2\theta = \frac{2-a^2}{2} \cdot \frac{2-a^2}{2} + \frac{a}{2}\sqrt{4-a^2} \cdot \frac{a}{2}\sqrt{4-a^2} = 1.$$

$$\therefore 2 \theta = 0^{\circ}, \text{ or } \theta = 0^{\circ}.$$

- 20.* Show that $\tan^{-1} \frac{\sqrt{1-a^2}}{a} + \sin^{-1} a$ is constant for all possible values of a.
- 21.* Show that $\operatorname{vers}^{-1} a 2 \cot^{-1} \sqrt{\frac{2-a}{a}}$ is constant for all possible values of a.
- 22.* Show that $\text{vers}^{-1} \frac{x}{12} 2 \sin^{-1} \sqrt{\frac{x}{24}}$ is constant for all possible values of x.
- 76. To prove that $\tan x > x > \sin x$ when $x < \frac{\pi}{2}$, x being expressed in Circular Measure. Let AOB = BOC = x, the radius being unity. Evidently AT > SB, or $\tan x > \sin x$.

Also, since the shortest distance from a point to a line is perpendicular to the line, SB < AB, or $\sin x < x$.

The arc AC may be considered as composed of an infinite number of infinitesimal straight lines; hence AT + TC > arc ABC, since ABC is a convex polygon lying in the triangle formed by a chord AC with the tangent lines TA and TC. The

$$2AT > \text{arc }ABC$$
, or $AT > \text{arc }AB$, or $\tan x > x$.

Hence $\tan x > x$, and $x > \sin x$. Q.E.D.

77. To prove that $\sin x$, $\tan x$, and x approach Equality as the Angle x approaches Zero.—As the angle AOT decreases,

^{*} When the angles are less than 90°.

the points B and T approach A, and hence approach each other. But

$$\frac{SB}{AT} = \frac{\sin x}{\tan x} = \cos x.$$

When the angle x approaches zero as its limit, $\cos x$ approaches unity as its limit. Hence $\frac{SB}{AT}$, or $\frac{\sin x}{\tan x}$, approaches unity as its limit, or $\sin x$ and $\tan x$ approach equality.

The arc x is intermediate in value between $\sin x$ and $\tan x$; hence the three quantities approach equality as the angle becomes smaller. That is, the three ratios

$$\frac{\sin x}{\tan x}$$
, $\frac{\sin x}{x}$, $\frac{\tan x}{x}$

approach unity as the angle approaches zero.

Hence we may say that when the angle is small, its sine and its tangent are equal to the arc itself, and its cosine is equal to unity. The smaller the angle, the more nearly correct will be the assumption.

78. Development of $\sin x$, of $\cos x$, and of $\tan x$. — Let us assume that

$$\sin x = a + bx + cx^2 + dx^3 + ex^4 + fx^5 + \dots \tag{1}$$

is true for all values of x. Then it is true when x has the values + y and - y; hence

$$\sin y = a + by + cy^2 + dy^3 + ey^4 + fy^5 + \dots$$
 (2)

and
$$\sin(-y) = a - by + cy^2 - dy^3 + ey^4 - fy^5 + \cdots$$
 (3)

But $\sin y = -\sin(-y)$, or $\sin y + \sin(-y) = 0$. Adding (2) and (3),

$$2 a + 2 cy^2 + 2 ey^4 + \dots = 0. (4)$$

But (4) is true for all values of y, since (1) is true for all values of x. In order that all values of y may reduce the left member of (4) to zero, we must have $a=0, c=0, e=0, \dots$ Hence (1) becomes

$$\sin x = bx + dx^3 + fx^5 + \dots \tag{5}$$

or
$$\frac{\sin x}{x} = b + dx^2 + fx^4 + \dots \tag{6}$$

But as x approaches zero, $\frac{\sin x}{x}$ approaches unity, and $b + dx^2 + fx^4 + \cdots$ approaches b. Hence

$$1 = b, \tag{7}$$

and (5) becomes

$$\sin x = x + dx^3 + fx^5 + \cdots \tag{8}$$

Again, let

$$\cos x = A + Bx + Cx^2 + Dx^3 + Ex^4 + Fx^5 + \dots$$
 (9)

Since $\cos x = \cos(-x)$, we have

$$A + Bx + Cx^{2} + Dx^{3} + Ex^{4} + Fx^{5} + \cdots$$

$$= A - Bx + Cx^{2} - Dx^{3} + Ex^{4} - Fx^{5} + \cdots$$
(10)

or
$$2Bx + 2Dx^3 + 2Fx^5 + \dots = 0.$$
 (11)

In order that this may be true for all values of x, we must have B=0, D=0, F=0..., and (9) becomes

$$\cos x = A + Cx^2 + Ex^4 + \cdots \tag{12}$$

But when x = 0, (12) reduces to

$$1 = A, \tag{13}$$

and hence (12) becomes

$$\cos x = 1 + Cx^2 + Ex^4 + \cdots \tag{14}$$

Substituting from (14) and (8) in the formula

$$\cos 2x = \cos^2 x - \sin^2 x,$$

we have
$$1 + 4 Cx^2 + 16 Ex^4 + \dots = 1 + (2 C - 1)x^2 + (2 E + C^2 - 2 d)x^4 + \dots$$
 (15)

Equating the coefficients of like powers of x,

$$4 C = 2 C - 1,$$
 or $2 C + 1 = 0.$ (16)

16
$$E = 2 E + C^2 - 2 d$$
, or $14 E - C^2 + 2 d = 0$. (17)

Substituting from (14) and (8) in the formula

$$\sin 2x = 2\sin x \cos x$$

we have
$$2x + 8 dx^3 + 32 fx^5 + \dots = 2x + 2 (C+d)x^3 + 2(E+Cd+f)x^5 + \dots$$
 (18)

CROCK, TRIG. -- 6

Equating the coefficients of like powers of x,

$$4 d = C + d$$
, or $3 d - C = 0$. (19)

$$16 f = E + Cd + f$$
, or $15 f - E - Cd = 0$. (20)

From (16),
$$C = -\frac{1}{2}$$
. (21)

From (19),
$$d = -\frac{1}{6} = -\frac{1}{3}$$
 (22)

From (17),
$$E = +\frac{1}{24} = +\frac{1}{4}$$
 (23)

From (20),
$$f = +\frac{1}{120} = +\frac{1}{5}$$
 (24)

These values, substituted in (8) and (14), give

$$\sin x = x - \frac{x^3}{\boxed{3}} + \frac{x^5}{\boxed{5}} - \cdots \tag{25}$$

$$\cos x = 1 - \frac{x^2}{2} + \frac{x^4}{4} - \cdots \tag{26}$$

Dividing (25) by (26),

$$\tan x = x + \frac{1}{3}x^3 + \frac{2}{15}x^5 + \dots$$
(27)

In (25), (26), and (27), which are the required developments, x must be expressed in circular measure.

79. Computation of the Trigonometric Functions (First Method). — The functions may be computed by (25), (26), and (27), Art. 78. Thus, to find $\sin 20^{\circ}$, we place $x = \frac{1}{9}\pi$, the circular measure of 20° .

$$\log \pi^{3} = 1.49145 \qquad \log \pi^{5} = 2.4857 \qquad x = \frac{\pi}{9} = 0.34906 59$$

$$\cot 9^{3} = 7.13727 - .10 \qquad \cot 9^{5} = 5.2288 - 10 \qquad \frac{x^{3}}{|3|} = 0.00708 88$$

$$\cot 6 = 9.22185 - 10 \qquad \cot 120 = 7.9208 - 10 \qquad 0.34197 71$$

$$\log \frac{x^{3}}{|3|} = 7.85057 - 10 \qquad \log \frac{x^{5}}{|5|} = 5.6353 - 10 \qquad \frac{x^{5}}{|5|} = 0.00004 32$$

$$\therefore \frac{x^{3}}{|3|} = 0.0070888 \qquad \therefore \frac{x^{5}}{|5|} = 0.0000432 \qquad \therefore \sin 20^{\circ} = 0.34202 03$$

In the tables, $\sin 20^{\circ} = 0.34202$.

80. Computation of the Trigonometric Functions (Second Method). — From (25), Art. 78, it may be shown that

 $\sin 1'' = 0.00000484813681107637,$

while $\operatorname{arc} 1'' = 0.00000484813681109536$.

 \therefore arc $1'' - \sin 1'' = 0.00000\ 00000\ 00000\ 0\overline{2}$.

Again, $\sin 1' = 0.00029 08882 04563 42460$,

while arc 1' = 0.00029 08882 08665 72160.

Again, $\sin 1^{\circ} = 0.01745 24064 37283 51282$,

while $arc 1^{\circ} = 0.01745 32925 19943 29577.$

... arc $1^{\circ} - \sin 1^{\circ} = 0.00000 \ 0\overline{9}$.

Also, from (26), Art. 78,

 $\cos 1' = 0.999999957692 = 1 - 0.000000042308.$

 $\cos 1^{\circ} = 0.9998476952 = 1 - 0.00015.$

In computing a set of five-place tables, we may assume

 $\sin 1' = \text{arc } 1' = 0.00029 08882 \text{ with an error of } \overline{5} \times 10^{-12},$

and $\cos 1' = 1$ with an error of 4×10^{-8} . Then $\sin 2' = 2 \sin 1' \cos 1'$; $\cos 2' = \cos^2 1' - \sin^2 1'$.

 $\sin 3' = \sin 2' \cos 1' + \cos 2' \sin 1';$

 $\cos 3' = \cos 2' \cos 1' - \sin 2' \sin 1'.$

 $\sin 4' = \sin (3' + 1'); \cos 4' = \cos (3' + 1'),$

or $\sin 4' = 2 \sin 2' \cos 2'$; $\cos 4' = \cos^2 2' - \sin^2 2'$.

And so on.

This method would be employed until the functions of all angles less than 30° had been computed. Then, since

$$\sin (30^{\circ} + x) = \cos x - \sin (30^{\circ} - x),$$

and $\cos (30^{\circ} + x) = \cos (30^{\circ} - x) - \sin x$,

the functions of angles between 30° and 45° would be found by combining the functions already found. Thus, if $x = 10^{\circ}$, we

have $\sin 40^{\circ} = \cos 10^{\circ} - \sin 20^{\circ},$

and $\cos 40^{\circ} = \cos 20^{\circ} - \sin 10^{\circ}.$

It is possible to compute independently the sine and cosine of 3°, 6°, 9°, ..., 39°, 42°, 45°. We have found in this chapter* the sine and cosine of 15°, of 18°, and of 36°, and we have

$$3^{\circ}=18^{\circ}-15^{\circ}$$
, $6^{\circ}=36^{\circ}-30^{\circ}$, $9^{\circ}=45^{\circ}-36^{\circ}$, $12^{\circ}=30^{\circ}-18^{\circ}$, $21^{\circ}=36^{\circ}-15^{\circ}$, $24^{\circ}=45^{\circ}-21^{\circ}$, $27^{\circ}=45^{\circ}-18^{\circ}$, $33^{\circ}=18^{\circ}+15^{\circ}$, $39^{\circ}=45^{\circ}-6^{\circ}$, $42^{\circ}=45^{\circ}-3^{\circ}$.

The values found from these relations would serve as checks upon the computation.

The computations may also be checked by Euler's and Legendre's verification formulas:

$$\sin (36^{\circ} + A) - \sin (36^{\circ} - A) - \sin (72^{\circ} + A) + \sin (72^{\circ} - A)$$

= $\sin A$.

$$\cos (36^{\circ} + A) + \cos (36^{\circ} - A) - \cos (72^{\circ} + A) - \cos (72^{\circ} - A)$$

= $\cos A$.

81. Approximate Assumptions. — It can be shown that

$$\tan 1'' - \arctan 1'' = 0.00000\ 00000\ 00000\ 0\frac{1}{4};$$

$$\arctan 1'' - \sin 1'' = 0.00000\ 00000\ 00000\ 0\frac{1}{2};$$

$$\tan 1'' - \sin 1'' = 0.00000\ 00000\ 00000\ 0\frac{1}{6}.$$

Hence we may assume that

$$\sin 1^{\prime\prime} = \tan 1^{\prime\prime} = \operatorname{arc} 1^{\prime\prime}. \tag{1}$$

In the whole circumference of a circle there are 1296000'', so that the error due to placing arc $1'' = \sin 1''$ in finding the circumference of a circle with a radius of unity will be only $2\frac{1}{2}$ units in the eleventh decimal place.

In the computation of elliptic orbits there occurs the equation $M = E - e \sin E$,

where M and E are expressed in circular measure. If M'' is the number of seconds in the angle, M = M'' are 1'', and approximately M = M'' sin 1'' and $E = E'' \sin 1''$.

Hence the equation may be written

$$M^{\prime\prime}=E^{\prime\prime}-\frac{e}{\sin 1^{\prime\prime}}\sin E.$$

* Ex. 3, Art. 69, and Ex. 8, Art. 71.

Another assumption that is often made is that for small angles $\sin n'' = n \sin 1''$. (2)

The error introduced is

for 1',
$$n'' = 60''$$
, error = $+ 0.00000\ 00000\ 04$;
for 1°, $n'' = 3600''$, error = $+ 0.00000\ 0\overline{9}$.

Thus, if $\sin \alpha = 0.4 \sin 2^{\circ}$, we should have, since α must be small, $\alpha'' \sin 1'' = 0.4 \sin 2^{\circ}$ or $\alpha'' = \frac{0.4 \sin 2^{\circ}}{\sin 1''}$.

82. Transform the First Member into the Second (or last) in the following examples:

1.
$$\frac{\cos \alpha - \sec \alpha}{\sec \alpha} = 4 \cos^2 \frac{1}{2} \alpha (\cos^2 \frac{1}{2} \alpha - 1).$$

The first member contains the angle α and the second $\frac{1}{2}\alpha$; hence we must change the angle.

$$\frac{\cos \alpha - \frac{1}{\cos \alpha}}{\frac{1}{\cos \alpha}} = \cos^2 \alpha - 1 = (2\cos^2 \frac{1}{2}\alpha - 1)^2 - 1$$
$$= 4\cos^4 \frac{1}{2}\alpha - 4\cos^2 \frac{1}{2}\alpha = 4\cos^2 \frac{1}{2}\alpha (\cos^2 \frac{1}{2}\alpha - 1).$$

- 2. $\csc 2 \alpha + \cot 2 \alpha = \cot \alpha$.
- 8. $\frac{\csc 2 \alpha \cot 2 \alpha}{\csc 2 \alpha + \cot 2 \alpha} = \tan^2 \alpha.$
- 4. $\cot \alpha \tan \alpha = 2 \cot 2 \alpha$.

We may either reduce the expression as far as possible before changing the angle, or change the angle and then reduce.

(a)
$$\frac{\cos \alpha}{\sin \alpha} - \frac{\sin \alpha}{\cos \alpha} = \frac{\cos^2 \alpha - \sin^2 \alpha}{\sin \alpha \cos \alpha} = \frac{\cos 2 \alpha}{\frac{1}{2} \sin 2 \alpha} = 2 \cot 2 \alpha.$$

(b)
$$\frac{1+\cos 2\alpha}{\sin 2\alpha} - \frac{1-\cos 2\alpha}{\sin 2\alpha} = \frac{2\cos 2\alpha}{\sin 2\alpha} = 2\cot 2\alpha.$$

Note. - Avoid radicals if possible.

- 5. $\sec a \csc a = 2 \csc 2 a$.
- 8. $\cot \frac{1}{2}\theta + \tan \frac{1}{2}\theta = 2 \csc \theta$.
- 6. $(\sin \frac{1}{2}\theta + \cos \frac{1}{2}\theta)^2 = 1 + \sin \theta$.
- 9. $\sin x 2 \sin^3 x = \sin x \cos 2 x$.

7.
$$\frac{1 - \tan^2 \frac{1}{2} v}{1 + \tan^2 \frac{1}{2} v} = \cos v.$$

10.
$$\frac{1}{2} (\sec \theta + \sec^2 \theta) = \frac{1 + \tan^2 \frac{1}{2} \theta}{(1 - \tan^2 \frac{1}{4} \theta)^2}$$

11.
$$\frac{2\tan\frac{1}{2}v}{1+\tan^2\frac{1}{2}v}=\sin v.$$

13.
$$1 + \tan x \tan \frac{1}{2} x = \sec x$$
.

14.
$$\frac{1}{2}(1 + \tan \frac{1}{2}a)^2 = \frac{1 + \sin a}{1 + \cos a}$$

12.
$$\frac{\sec^2\theta}{2-\sec^2\theta}=\sec 2\theta.$$

15.
$$\tan \frac{1}{2} a + 2 \sin^2 \frac{1}{2} a \cot a = \sin a$$
.

16.
$$\frac{\sin x (1 - \tan^2 x)}{\sec^2 x} \left(\frac{1}{\cos x - \sin x} + \frac{1}{\cos x + \sin x} \right) = \sin 2 x.$$

17.
$$(1 - \tan^2 \theta) \sin \theta \cos \theta = \cos 2 \theta \sqrt{\frac{1 - \cos 2 \theta}{1 + \cos 2 \theta}}$$

18.
$$\frac{1 + \tan^2 \alpha}{1 - \tan^2 \alpha} = \sec 2 \alpha$$
.

20.
$$\frac{\sec \theta + \cos \theta + 2}{\sec \theta + \cos \theta - 2} = \cot^{\frac{1}{2}} \theta.$$

19.
$$\frac{\cos \theta - \sin \theta}{\cos \theta + \sin \theta} = \frac{1 - \sin 2\theta}{\cos 2\theta} = \frac{\cos 2\theta}{1 + \sin 2\theta}.$$
 21.*
$$\tan \theta \frac{1 + \tan \frac{1}{2}\theta}{1 - \tan \frac{1}{2}\theta} = \frac{\sin \theta}{1 - \sin \theta}.$$

$$21.* \tan \theta \frac{1 + \tan \frac{1}{2} \theta}{1 - \tan \frac{1}{2} \theta} = \frac{\sin \theta}{1 - \sin \theta}$$

22.
$$\sec 2 a + \tan 2 a + 1 = \frac{2}{1 - \tan a}$$

23.
$$(\sqrt{1+\sin a} - \sqrt{1-\sin a})^2 = 4\sin^2 \frac{1}{2}a$$
.

24.
$$(\sqrt{1+\sin a}+\sqrt{1-\sin a})^2=4\cos^2\frac{1}{2}a$$
.

25.
$$2 \sin A - \sin (A - B) - 4 \sin A \sin^2 \frac{1}{2} B = \sin (A + B)$$
.

26.†
$$\cos (36^{\circ} + A) + \cos (36^{\circ} - A) - \cos (72^{\circ} + A) - \cos (72^{\circ} - A) = \cos A$$
.

27.
$$t \sin (36^{\circ} + A) - \sin (36^{\circ} - A) - \sin (72^{\circ} + A) + \sin (72^{\circ} - A) = \sin A$$
.

28.
$$\frac{\sin x + \sin 2 x}{\cos x - \cos 2 x} = \cot \frac{1}{2} x$$
.

29.
$$1 + \cot^2 \frac{1}{2} v = \frac{2}{\sin v \tan \frac{1}{2} v}$$

30.
$$\tan^3 \frac{1}{2} v (1 + \cot^2 \frac{1}{2} v)^3 = \frac{8}{\sin^3 v}$$

31.
$$\frac{\sin \alpha \cos \frac{1}{2} \alpha - 2 \cos \alpha \sin \frac{1}{2} \alpha}{2 \sin \frac{1}{2} \alpha - \sin \alpha} = 2 \cos^2 \frac{1}{4} \alpha.$$

32.
$$\frac{\tan^2 \frac{1}{2} x + \cot^2 \frac{1}{2} x}{\tan^2 \frac{1}{2} x - \cot^2 \frac{1}{2} x} = -\frac{1 + \cos^2 x}{2 \cos x}.$$

33. Given
$$\tan \frac{1}{2} v = \sqrt{\frac{1+e}{1-e}} \tan \frac{1}{2} E$$
, show that

$$\frac{1}{(1+e)\cos^2\frac{1}{2}v + (1-e)\sin^2\frac{1}{2}v} = \frac{1-e\cos E}{1-e^2}.$$

34.
$$\tan(45^{\circ} + A) - \tan(45^{\circ} - A) = 2 \tan 2A$$
.

(a)
$$\frac{\tan 45^{\circ} + \tan A}{1 - \tan 45^{\circ} \tan A} - \frac{\tan 45^{\circ} - \tan A}{1 + \tan 45^{\circ} \tan A}$$
$$= \frac{1 + \tan A}{1 - \tan A} - \frac{1 - \tan A}{1 + \tan A} = \frac{4 \tan A}{1 - \tan^{2} A} = 2 \tan 2A.$$

* After substituting, multiply both numerator and denominator by the quantity $\sin \theta - 1 + \cos \theta$.

$$t \cos 36^{\circ} = \frac{1}{4}(1 + \sqrt{5}).$$

(b)
$$\frac{1 - \cos(90^{\circ} + 2A)}{\sin(90^{\circ} + 2A)} - \frac{1 - \cos(90^{\circ} - 2A)}{\sin(90^{\circ} - 2A)}$$

$$= \frac{1 + \sin 2A}{\cos 2A} - \frac{1 - \sin 2A}{\cos 2A} = \frac{2\sin 2A}{\cos 2A} = 2\tan 2A.$$

35.
$$\frac{\tan(45^{\circ} + \frac{1}{2}A) + \tan(45^{\circ} - \frac{1}{2}A)}{\tan(45^{\circ} + \frac{1}{2}A) - \tan(45^{\circ} - \frac{1}{2}A)} = \csc A.$$

36.
$$\tan (45^{\circ} + \theta) - \cot (45^{\circ} + \theta) = 2 \tan 2\theta$$

37.
$$\tan^2(45^\circ + \theta) + \cot^2(45^\circ + \theta) = 2 + 4\tan^2 2\theta$$
.

38.
$$\tan^2 (45^\circ + \alpha) - \cot^2 (45^\circ + \alpha) = 4 \tan 2 \alpha \sec 2 \alpha$$
.

39.
$$\frac{\tan (45^{\circ} + \frac{1}{2} \theta)}{\tan (45^{\circ} - \frac{1}{2} \theta)} = \frac{1 + \sin \theta}{1 - \sin \theta}$$

40.
$$\tan \theta \tan (45^{\circ} + \frac{1}{2} \theta) = \frac{\sin \theta}{1 - \sin \theta}$$

41.
$$\cot (45^{\circ} - \frac{1}{2} \alpha) - \tan (45^{\circ} - \frac{1}{2} \alpha) = 2 \tan \alpha$$
.

42.
$$\tan^2(45^\circ + \frac{1}{2}\alpha) = \frac{1 + \sin \alpha}{1 - \sin \alpha}$$

43.
$$\tan (45^{\circ} + \theta) + \tan (45^{\circ} - \theta) = 2 \sec 2 \theta$$
.

44.
$$\frac{1-\tan^2(45^\circ-\theta)}{1+\tan^2(45^\circ-\theta)} = \sin 2\theta$$
.

45.
$$\tan (45^{\circ} + \frac{1}{2}x) \frac{1 + \tan \frac{1}{2}x}{1 - \tan \frac{1}{2}x} = \frac{1 + \sin x}{1 - \sin x}$$

46.
$$\frac{\tan(45^\circ + \frac{1}{2}x)}{1 + \cot^2(45^\circ + \frac{1}{2}x)} = \frac{1}{2}\cos x \frac{1 + \sin x}{1 - \sin x}$$

47.
$$\sin (45^{\circ} - \frac{1}{2}\theta) + \cos (45^{\circ} - \frac{1}{2}\theta) = \sqrt{2} \cos \frac{1}{2}\theta = \frac{\sin \theta}{\sqrt{1 - \cos \theta}}$$

CHAPTER VI.

TRIGONOMETRIC EQUATIONS.

- 83. One Equation Containing Multiple Angles.*—Change the equation so that it shall contain a single angle, and then proceed as in Art. 52.
 - 1. $\cos 3x = \sin 2x$; find x. (See Ex. 8, Art. 71.) $4\cos^3 x - 3\cos x = 2\sin x\cos x$. $\therefore \cos x (1 - 4\sin^2 x - 2\sin x) = 0$. $\therefore \cos x = 0$, giving $x = 90^\circ$ and 270° ;

and $1-4\sin^2 x - 2\sin x = 0$, giving $\sin x = \frac{1}{4}(\sqrt{5}-1)$ and $\sin x = -\frac{1}{4}(\sqrt{5}+1)$, or $x = 18^\circ$, 162° , 234° , 306° .

- 2. $\cos 2\theta + \cos \theta = -1$; find θ . Ans. 90°, 270°, 120°, 240°.
- 3. $\cot 2\theta + \tan \theta = -\frac{2}{3}\sqrt{3}$; find θ . Ans. 150°, 330°, 120°, 300°.
- 4. $\cos 2x + \sin x = +1$; find x. Ans. 0°, 30°, 150°, 180°.
- 5. $\sin 3x + \sin 2x = \sin x$; find x. Ans. 0°, 180°, 60°, 300°.
- 6. $\tan 2x = -2\sin x$; find x. Ans. 0°, 60°, 180°, 300°.
- 7. $\tan 2x \tan x = +1$; find x. Ans. 30°, 150°, 210°, 330°. 8. $\tan^2 x \tan 2x + 2 \tan x = +\sqrt{3}$; find x. Ans. 30°, 120°, 210°, 300°.
- 9. $\sin 4z 2\sin 2z = 0$; find z. Ans. 0°, 90°, 180°, 270°.

The equation may sometimes be solved by the use of the equations of Art. 73.

10.
$$\cos 3x - \sin 2x = 0$$
; find x .
 $\cos 3x - \sin 2x = \sin (90^{\circ} + 3x) - \sin 2x$
 $= 2\cos (45^{\circ} + \frac{5}{2}x)\sin (45^{\circ} + \frac{1}{2}x) = 0$.
 $\cos (45^{\circ} + \frac{5}{2}x) = 0$ gives $45^{\circ} + \frac{5}{2}x = 90^{\circ}$, 270° , 450° , 630° , 810° , or $x = 18^{\circ}$, 90° , 162° , 234° , 306° .

or $\sin (45^{\circ} + \frac{1}{2}x) = 0$ gives $45^{\circ} + \frac{1}{2}x = 0^{\circ}$, 180° , $x = -90^{\circ}$ and 270° .

^{*} See Art. 52 for the solution of equations when only one angle is involved

11. $\cos \theta - \cos 3 \theta = \sin 2 \theta$; find θ by both methods.

Ans. 0°, 30°, 90°, 150°, 180°, 270°.

12. $\sin 3\theta + \sin 2\theta + \sin \theta = 0$; find θ by both methods.

Ans. 0°, 90°, 120°, 180°, 240°, 270°.

13. $\cos 2\theta = \sin \theta$; find θ by both methods.

Ans. 30°, 150°, 270°.

14. $\cos 5\theta - \cos 3\theta + \sin \theta = 0$; find θ . Ans. 0°, 180°, $(2n + \frac{1}{2} \pm \frac{1}{3})\frac{\pi}{4}$.

Ans. 90°, 270°, $(2 n + \frac{3}{2}) \frac{\pi}{4}$ 15. $\sin 5 \theta + \sin 3 \theta + 2 \cos \theta = 0$; find θ .

16. $\sin (60^{\circ} - x) - \sin (60^{\circ} + x) = +\frac{1}{2} \sqrt{3}$; find x. Ans. 240°, 300°.

17. $\sin (30^{\circ} + x) - \cos (60^{\circ} + x) = -\frac{1}{2} \sqrt{3}$; find x. Ans. 210°, 330°.

18. $\cos 4z - \cos 2z = 0$; find z. Ans. 0°, 60°, 120°, 180°, 240°, 300°.

84. Find r and ϕ from the Equations

(2)

a and b being known.

(1) ÷ (2) gives
$$\tan \phi = \frac{a}{b}$$
 (3)

From (1) and (2)
$$r = \frac{a}{\sin \phi} = \frac{b}{\cos \phi}.$$
 (4)

1. Find r and ϕ when $\log a = 0.47141$, and $\log b = 0.63927 n$, r being positive.

$$\log(r\sin\phi) = \log a = 0.47141\tag{1}$$

$$\log \sin \phi = 9.74972 \tag{5}$$

$$\log\cos\phi = 9.91758\,n\tag{6}$$

$$\log(r\cos\phi) = \log b = 0.63927 \, n \tag{2}$$

$$(1) - (2) = \log \tan \phi = 9.83214 \, n \tag{3}$$

$$\phi = 145^{\circ} \, 48'.4 \tag{4}$$

$$(1) - (5) = (2) - (6) = \log r = 0.72169 \tag{7}$$

$$r = 5.2685$$
 (8)

The numbers on the right indicate the order in which the quantities are found. If the two values of $\log r$ had differed, we should have taken that found from $\log \cos \phi$, as a small error in $\log \tan \phi$ would, for this value of ϕ , affect the logarithmic cosine less than the logarithmic sine. The angle ϕ is placed in the second quadrant, since $r\cos\phi$ is negative and $r\sin\phi$ positive, r being considered positive.

2. Find r and ϕ when $\log \alpha = 0.46843 n$, and $\log b = 0.43742$, r being positive. Ans. $\phi = 312^{\circ} 57'.4$; r = 4.0178.

3. Find r and ϕ when $\log a = 1.46444 n$, and $\log b = 1.86903 n$, r being positive. Ans. $\phi = 201^{\circ} 30'.0$; r = 79.497.

Find r, ϕ , and θ from the Equations

$$r\cos\phi\cos\theta=a,$$
 (1)

$$r \sin \phi \cos \theta = b,$$
 (2)

$$r \cos \phi \cos \theta = a,$$

$$r \sin \phi \cos \theta = b,$$

$$r \sin \theta = c,$$
(1)
(2)
(3)

a, b, and c being known.

(2) ÷ (1) gives
$$\tan \phi = \frac{b}{a}$$
 (4)

From (1) and (2),
$$r \cos \theta = \frac{a}{\cos \phi} = \frac{b}{\sin \phi}$$
 (5)

From (3),
$$r \sin \theta = c$$
. (6)

(6) ÷ (5) gives
$$\tan \theta = \frac{c \cos \phi}{a} = \frac{c \sin \phi}{b}.$$
 (7)

From (5) and (6),

$$r = \frac{a}{\cos \phi \cos \theta} = \frac{b}{\sin \phi \cos \theta} = \frac{c}{\sin \theta}.$$
 (8)

1. Given $\log a = 0.46472$, $\log b = 0.72413 n$, $\log c = 0.62817$, find r, ϕ , and θ , θ being numerically less than 90°, and r being positive.

$$\log(r\cos\phi\cos\theta) = \log a = 0.46472 \tag{1}$$

$$\log \cos \phi = (9.68314)$$
 Only as a check. (5)

$$\log \sin \phi = 9.94256 n \tag{5}$$

$$\log (r \sin \phi \cos \theta) = \log b = 0.72413 n \tag{2}$$

(2)
$$-$$
 (1) = log tan $\phi = 0.25941 n$ (3)
 $\phi = 298^{\circ} 49'.4$ (4)

$$\phi = 298^{\circ} 49'.4 \tag{4}$$

$$(2) - (5) = (1) - (5) = \log(r \cos \theta) = 0.78157 \tag{6}$$

$$\log\cos\theta = 9.91291 \tag{10}$$

$$\log \sin \theta = (9.75951)$$
 Only as a check. (10)

$$\log c = \log (r \sin \theta) = 0.62817 \tag{7}$$

$$(7) - (6) = \log \tan \theta = 9.84660 \tag{8}$$

$$\theta = 35^{\circ} 5'.1 \tag{9}$$

$$(6) - (10) = (7) - (10) = \log r = 0.86866 \tag{11}$$

$$r = 7.3903$$
 (12)

The angle ϕ is placed in the fourth quadrant, since $r\cos\theta$ is positive, and therefore $\cos \phi$ must be positive and $\sin \phi$ negative, $r \cos \phi \cos \theta$ being positive and $r \sin \phi \cos \theta$ negative.

2. Given $\log a = 0.26903 \, n$, $\log b = 0.32426$, $\log c = 0.36903 \, n$, find r, ϕ , and θ , r being positive and θ numerically less than 90°.

Ans.
$$\phi = 131^{\circ} 22'.0$$
; $\theta = -39^{\circ} 45'.6$; $r = 3.6572$.

3. Given $\log a = 9.43942 n$, $\log b = 9.40403 n$, $\log c = 9.56700 n$, find r, ϕ , and θ , r being positive and θ numerically less than 90°.

Ans.
$$\phi = 222^{\circ} 40'.1$$
; $\theta = -44^{\circ} 36'.4$; $r = 0.525425$ or 0.52544 ,

86. Find ϕ from the Equation

$$a \sin \phi + b \cos \phi = c \tag{1}$$

by formulas adapted to logarithmic computation, a, b, and c being known.

Let M be an auxiliary angle and m a positive constant, so that

$$\begin{array}{l}
 m \sin M = a, \\
 m \cos M = b.
 \end{array}$$
(2)

The angle M is always possible, for we have, by division,

$$\tan M = \frac{a}{b},\tag{3}$$

and since the tangent may have any value between $+\infty$ and $-\infty$, there will always be some angle whose tangent is equal to $\frac{a}{b}$. Also, squaring and adding Eqs. (2), we have

$$m^2 \sin^2 M + m^2 \cos^2 M = m^2 = a^2 + b^2,$$

 $m = \sqrt{a^2 + b^2}.$ (4)

Therefore the assumptions in (2) are always possible, since M and m will be real quantities if a and b are real.

Substituting (2) in (1), we have

 \mathbf{or}

$$m \sin M \sin \phi + m \cos M \cos \phi = c$$
,

or
$$m\cos(\phi - M) = c.$$
 (5)

Hence, from (2) find M and m by the method of Art. 84; from (5) find $\phi - M$ (two values $< 360^{\circ}$), and thence find ϕ .

1. Find ϕ when $2 \sin \phi - 3 \cos \phi = 1$.

Ans.
$$M = 146^{\circ} 18'.6$$
; $\phi = 220^{\circ} 12'.5$, or $72^{\circ} 24'.7$.

2. Find ϕ when $2\sin\phi + 4\cos\phi = -3$.

Ans.
$$M = 26^{\circ} 33'.9$$
; $\phi = 158^{\circ} 41'.8$, or $254^{\circ} 26'.0$.

87. Find ϕ from the Equation

$$a \tan \phi + b \cot \phi = c$$

by formulas adapted to logarithmic computation, a, b, and c being known.

Substituting for $\tan \phi$ and $\cot \phi$ in terms of $\sin \phi$ and $\cos \phi$, we have, after reducing,

$$(a-b)\cos 2\phi + c\sin 2\phi = a+b.$$

Let
$$m \sin M = a - b$$
,
 $m \cos M = c$. $\cdot \cdot \cdot m \sin (M + 2 \phi) = a + b$.

1. Find ϕ when $2 \tan \phi - \cot \phi = -3$.

Ans.
$$M = 135^{\circ}$$
; $\phi = 15^{\circ} 41'.0$, $119^{\circ} 19'.0$, $195^{\circ} 41'.0$, $299^{\circ} 19'.0$.

2. Find ϕ when $\tan \phi + 3 \cot \phi = -2 \sqrt{3}$.

Ans.
$$M = 210^{\circ}$$
; $\phi = 120^{\circ}$ or 300°.

88. Find ϕ from the Following Equations, α and α being known:

(a)
$$\sin(\phi + \alpha) = a \sin \phi$$
. (1)

Expanding, $\sin \phi \cos \alpha + \cos \phi \sin \alpha = a \sin \phi$.

$$\therefore \sin \phi (a - \cos \alpha) = \cos \phi \sin \alpha.$$

$$\therefore \tan \phi = \frac{\sin \alpha}{\alpha - \cos \alpha} \tag{2}$$

Eq. (2) is not adapted to logarithmic computation. But from (1) we have

$$\frac{\sin\left(\phi+\alpha\right)}{\sin\phi}=\frac{a}{1},$$

and, by composition and division,

$$\frac{\sin(\phi + \alpha) + \sin\phi}{\sin(\phi + \alpha) - \sin\phi} = \frac{a+1}{a-1},$$

and this, from the equations of Art. 73, becomes

$$\frac{\tan(\phi + \frac{1}{2}\alpha)}{\tan\frac{1}{2}\alpha} = \frac{a+1}{a-1},$$

$$\tan(\phi + \frac{1}{2}\alpha) = \frac{a+1}{a-1}\tan\frac{1}{2}\alpha.$$
 (3)

 \mathbf{or}

Let $\tan \beta = a$, and note that $\tan 45^{\circ} = 1$.

$$\therefore \tan (\phi + \frac{1}{2}\alpha) = \frac{\tan \beta + \tan 45^{\circ}}{\tan \beta - \tan 45^{\circ}} \tan \frac{1}{2}\alpha$$

$$= \frac{\sin (\beta + 45^{\circ})}{\sin (\beta - 45^{\circ})} \tan \frac{1}{2}\alpha.$$

$$\therefore \tan (\phi + \frac{1}{2}\alpha) = \cot (\beta - 45^{\circ}) \tan \frac{1}{2}\alpha. \tag{4}$$

(b)
$$\cos(\phi + \alpha) = a \cos \phi$$
.

$$\therefore \tan (\phi + \frac{1}{2}\alpha) = \tan (45^{\circ} - \beta) \cot \frac{1}{2}\alpha, \text{ if } \tan \beta = \alpha.$$

(c)
$$\sin(\alpha - \phi) = a \sin \phi$$
.

$$\therefore \tan (\phi - \frac{1}{2}\alpha) = \tan (45^{\circ} - \beta) \tan \frac{1}{2}\alpha, \text{ if } \tan \beta = \alpha.$$

(d)
$$\sin(\phi + \alpha) = a\cos\phi$$
.

$$\therefore \sin(\phi + \alpha) = a \sin(90^{\circ} + \phi);$$

$$\therefore \tan (45^{\circ} + \phi + \frac{1}{2}\alpha) = \cot (45^{\circ} - \beta) \tan (45^{\circ} - \frac{1}{2}\alpha)$$
, if $\tan \beta = \alpha$.

(e)
$$\cos(\phi + \alpha) = a \sin \phi$$
.

$$\therefore \cos(\phi + \alpha) = a\cos(90^{\circ} - \phi);$$

...
$$\tan (\phi + \frac{1}{2}\alpha - 45^{\circ}) = \tan (45^{\circ} - \beta) \cot (45^{\circ} + \frac{1}{2}\alpha)$$
, if $\tan \beta = a$.

Note. — The equation $a \sin(\phi + a) = a' \sin(\phi + a')$ and similar equations may be solved by expansion, the solution of the given equation being

$$\tan \phi = \frac{a' \sin a' - a \sin a}{a \cos a - a' \cos a'}.$$

A solution adapted to logarithmic computation may be found by the method of this article, giving

$$\tan\left[\phi + \frac{1}{2}\left(\alpha + \alpha'\right)\right] = \cot\left(\beta - 45^{\circ}\right)\tan\frac{1}{2}\left(\alpha - \alpha'\right), \text{ if } \tan\beta = \frac{\alpha'}{\alpha}.$$

89. Find ϕ from the Following Equations, a and α being known:

(a)
$$\sin(\phi + \alpha)\sin\phi = a$$
.

From (8), Art. 72,

$$\cos \alpha - \cos (2 \phi + \alpha) = 2 a.$$

$$\therefore \cos(2\phi + \alpha) = \cos\alpha - 2a. \tag{1}$$

Let

$$\tan \beta = \frac{2 a}{\sin \alpha}.$$
 (2)

$$\therefore \cos(2\phi + \alpha) = \cos\alpha - \sin\alpha \tan\beta = \frac{\cos\alpha \cos\beta - \sin\alpha \sin\beta}{\cos\beta}$$

$$\therefore \cos(2\phi + \alpha) = \frac{\cos(\alpha + \beta)}{\cos\beta}.$$
 (3)

(b)
$$\sin (\alpha - \phi) \sin \phi = a$$
.

$$\cdots \cos(\alpha - 2\phi) - \cos\alpha = 2\alpha;$$

$$\therefore \cos(\alpha - 2\phi) = \cos\alpha + 2\alpha.$$

$$\therefore \cos(\alpha - 2\phi) = \frac{\cos(\alpha - \beta)}{\cos\beta}, \text{ if } \tan\beta = \frac{2\alpha}{\sin\alpha}.$$

(c)
$$\sin (\phi + \alpha) \cos \phi = a$$
.

$$\therefore \sin(2\phi + \alpha) + \sin\alpha = 2\alpha.$$

$$\therefore \sin(2\phi + \alpha) = 2\alpha - \sin\alpha = \frac{\sin(\beta - \alpha)}{\cos\beta}, \text{ if } \tan\beta = \frac{2\alpha}{\cos\alpha}.$$

(d) $\cos(\phi + \alpha)\cos\phi = a$.

$$\therefore \cos(2\phi + \alpha) + \cos\alpha = 2\alpha.$$

$$\therefore \cos(2\phi + \alpha) = 2\alpha - \cos\alpha = -\frac{\cos(\alpha + \beta)}{\cos\beta}, \text{ if } \tan\beta = \frac{2\alpha}{\sin\alpha}.$$

(e) $\cos(\phi + \alpha)\sin\phi = a$.

$$\therefore \sin(2\phi + \alpha) = 2\alpha + \sin\alpha = \frac{\sin(\alpha + \beta)}{\cos\beta}, \text{ if } \tan\beta = \frac{2\alpha}{\cos\alpha}.$$

- 90. Find ϕ from the Following Equations, α , α , and α' being known:
 - (a) $\tan (\phi + \alpha) = a \tan \phi$.

$$\frac{\tan (\phi + \alpha)}{\tan \phi} = \frac{a}{1}; \quad \frac{\tan (\phi + \alpha) + \tan \phi}{\tan (\phi + \alpha) - \tan \phi} = \frac{a+1}{a-1};$$

$$\frac{\sin (2\phi + \alpha)}{\sin \alpha} = \frac{a+1}{a-1}.$$
(1)

Let

$$\tan \beta = a; \tag{2}$$

$$\therefore \frac{a+1}{a-1} = \cot (\beta - 45^\circ),$$

and

$$\sin(2\phi + \alpha) = \cot(\beta - 45^{\circ})\sin\alpha. \tag{3}$$

Find β from (2) and $2\phi + \alpha$ from (3).

(b) $\tan (\phi + \alpha) = \alpha \cot \phi$.

$$\therefore \cos(2\phi + \alpha) = \tan(45^{\circ} - \beta)\cos\alpha$$
, if $\tan\beta = a$.

(c) $\cot (\alpha - \phi) = a \cot \phi$.

$$\therefore \sin(2\phi - \alpha) = \tan(\beta - 45^{\circ}) \sin \alpha, \text{ if } \tan \beta = \alpha.$$

(d)
$$\cot (\phi + \alpha) = a \cot (\phi - \alpha)$$
.

$$\therefore$$
 $\sin 2\phi = \cot (45^{\circ} - \beta) \sin 2\alpha$, if $\tan \beta = a$.

(e) $\tan (\phi + \alpha) = a \tan (\phi + \alpha')$.

$$\therefore \sin(2\phi + \alpha + \alpha') = \cot(\beta - 45^{\circ}) \sin(\alpha - \alpha'), \text{ if } \tan\beta = a.$$

$$(f) \cot(\phi + \alpha) = a \cot(\phi + \alpha').$$

$$\therefore \sin(2\phi + \alpha + \alpha') = \cot(\beta - 45^{\circ}) \sin(\alpha' - \alpha), \text{ if } \tan\beta = \alpha.$$

$$(g) \cot(\phi + \alpha) = \alpha \tan(\phi + \alpha').$$

$$\therefore$$
 cos $(2\phi + \alpha + \alpha') = \tan (\beta - 45^{\circ}) \cos (\alpha - \alpha')$, if $\tan \beta = \alpha$.

- 91. Find ϕ from the Following Equations, α , α , and α' being known:*
 - (a) $\tan (\phi + \alpha) \tan \phi = a$.

$$\therefore \sin(\phi + \alpha)\sin\phi = a\cos(\phi + \alpha)\cos\phi.$$

From the equations of Art. 72, we have

$$-\cos(2\phi + \alpha) + \cos\alpha = a\cos(2\phi + \alpha) + a\cos\alpha;$$

$$\therefore \cos(2\phi + \alpha) = \frac{1-a}{1+a}\cos\alpha.$$

Let

$$\tan \beta = \alpha.$$

$$\therefore \cos (2 \phi + \alpha) = \tan (45^{\circ} - \beta) \cos \alpha.$$

- (b) $\tan (\phi + \alpha) \cot \phi = \alpha$.
 - $\therefore \sin(2\phi + \alpha) = \cot(\beta 45^{\circ}) \sin \alpha, \text{ if } \tan \beta = \alpha.$
- (c) $\tan (\phi + \alpha) \tan (\phi \alpha) = \alpha$. $\therefore \cos 2\phi = \tan (45^{\circ} - \beta) \cos 2\alpha$, if $\tan \beta = \alpha$.
- (d) $\tan (\phi + \alpha) \cot (\phi + \alpha') = \alpha$.

$$\therefore \sin(2\phi + \alpha + \alpha') = \cot(\beta - 45^{\circ}) \sin(\alpha - \alpha'), \text{ if } \tan\beta = \alpha.$$

92. Find r and ϕ from the Following Equations, α , b, α , and β being known:

$$r\sin\left(\phi + \alpha\right) = \alpha, \ \ (1)$$

$$r\cos\left(\phi + \beta\right) = b.$$
 (2)

$$\therefore \frac{\sin(\phi + \alpha)}{\cos(\phi + \beta)} = \frac{a}{b}; \quad \therefore \quad b\sin(\phi + \alpha) = a\cos(\phi + \beta).$$

 $\therefore b \sin \phi \cos \alpha + b \cos \phi \sin \alpha = a \cos \phi \cos \beta - a \sin \phi \sin \beta.$

 $\therefore b \sin \phi \cos \alpha + a \sin \phi \sin \beta = a \cos \phi \cos \beta - b \cos \phi \sin \alpha.$

 $\therefore \sin \phi (b \cos \alpha + a \sin \beta) = \cos \phi (a \cos \beta - b \sin \alpha).$

$$\therefore \tan \phi = \frac{a \cos \beta - b \sin \alpha}{b \cos \alpha + a \sin \beta},$$
 (3)

and

$$r = \frac{a}{\sin(\phi + \alpha)} = \frac{b}{\cos(\phi + \beta)}.$$
 (4)

The quadrant of ϕ will be determined by the sign assigned to r.

* The method of Art. 90 may be used, since $\tan x = \frac{1}{\cot x}$ and $\cot x = \frac{1}{\tan x}$.

1. If $r \sin (\phi + \alpha) = a$, and $r \sin (\phi + \beta) = b$, show that

$$\tan \phi = \frac{a \sin \beta - b \sin \alpha}{b \cos \alpha - a \cos \beta}.$$

2. If $r\cos(\phi + a) = a$, and $r\cos(\phi + \beta) = b$, show that

$$\tan \phi = \frac{a \cos \beta - b \cos \alpha}{a \sin \beta - b \sin \alpha}.$$

93. Find r and ϕ from the Following Equations, α , b, α , and β being known, and the formulas derived being adapted to logarithmic computation:

$$r\sin\left(\phi + a\right) = a, \tag{1}$$

$$r\sin\left(\phi + \beta\right) = b.$$
 (2)

$$(1) + (2) = r \left[\sin \left(\phi + \alpha \right) + \sin \left(\phi + \beta \right) \right] = a + b;$$

$$\therefore 2r\sin\left[\phi + \frac{1}{2}(\alpha + \beta)\right]\cos\frac{1}{2}(\alpha - \beta) = a + b. \tag{3}$$

$$(1)-(2) = r\left[\sin\left(\phi+\alpha\right)-\sin\left(\phi+\beta\right)\right] = a-b;$$

$$\therefore 2r\cos\left[\phi + \frac{1}{2}(\alpha + \beta)\right]\sin\frac{1}{2}(\alpha - \beta) = a - b. \tag{4}$$

From (3) and (4), we have

$$r\sin\left[\phi + \frac{1}{2}(\alpha + \beta)\right] = \frac{a+b}{2\cos\frac{1}{2}(\alpha - \beta)},$$

$$r\cos\left[\phi + \frac{1}{2}(\alpha + \beta)\right] = \frac{a-b}{2\sin\frac{1}{2}(\alpha - \beta)},$$

from which r and $\phi + \frac{1}{2}(\alpha + \beta)$ are found by the method of Art. 84.

1. If $r\cos(\phi + \alpha) = a$, and $r\cos(\phi + \beta) = b$, show that $r\cos\left[\phi + \frac{1}{2}(\alpha + \beta)\right] = \frac{a+b}{2\cos\frac{1}{2}(\alpha - \beta)},$ $r\sin\left[\phi + \frac{1}{2}(\alpha + \beta)\right] = \frac{b-a}{2\sin\frac{1}{2}(\alpha - \beta)}.$

2. If $r\sin(\phi + a) = a$, and $r\cos(\phi + \beta) = b$, show that by placing $\cos(\phi + \beta) = \sin(90^{\circ} + \phi + \beta)$ we may obtain

$$r \sin \left[\phi + 45^{\circ} + \frac{1}{2} (\alpha + \beta)\right] = \frac{a + b}{2 \cos \left[45^{\circ} - \frac{1}{2} (\alpha - \beta)\right]},$$
$$r \cos \left[\phi + 45^{\circ} + \frac{1}{2} (\alpha + \beta)\right] = \frac{b - a}{2 \sin \left[45^{\circ} - \frac{1}{2} (\alpha - \beta)\right]}.$$

3. Find r and ϕ when $r \sin{(\phi + 100^\circ)} = 2$, and $r \sin{(\phi + 200^\circ)} = 3$, r being positive. Ans. $\phi = 290^\circ 28'.4$; r = 3.9436.

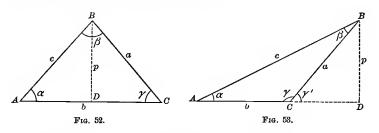

CHAPTER VII.

OBLIQUE PLANE TRIANGLES.

94. It has been shown in Geometry that a triangle can be constructed when three elements, one being a side, are known. If the three angles only are given, there will be an infinite number of triangles satisfying the conditions of the problem, since the data determine the *shape* and not the size of the triangle.

We also know that in any triangle

- (1) The sum of the three angles is 180°.
- (2) If one angle is 90°, the sum of the other two is 90°.
- (3) The greater side is opposite the greater angle, and conversely.
 - (4) Any side is less than the sum of the other two.
- 95. The Sine Proportion. The sides of a triangle are to each other as the sines of the opposite angles.

In Fig. 52, $p = a \sin \gamma$; $p = c \sin \alpha$. $\therefore a \sin \gamma = c \sin \alpha$. (1)

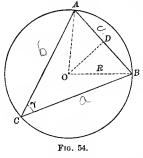

$$\therefore \frac{a}{c} = \frac{\sin \alpha}{\sin \gamma}, \text{ or } \frac{a}{\sin \alpha} = \frac{c}{\sin \gamma}$$
 (2)

CROCK. TRIG. -- 7

In Fig. 53,

 $p = a \sin \gamma' = a \sin (180^{\circ} - \gamma) = a \sin \gamma$, and $p = c \sin \alpha$. $\therefore a \sin \gamma = c \sin \alpha$, as before.

In the same way, by drawing a line perpendicular to AB from C (Figs. 52 and 53), we can show that

$$\frac{a}{\sin \alpha} = \frac{b}{\sin \beta}.$$

$$\therefore \frac{a}{\sin \alpha} = \frac{b}{\sin \beta} = \frac{c}{\sin \gamma}, \quad (3)$$

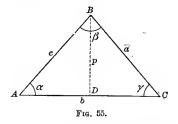

true for both acute and obtuse angled triangles.

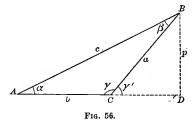

Note. — The constant quotient $\frac{a}{\sin a}$ is called the *modulus* of the triangle, and is equal to the diameter of the circumscribed circle.

For, in Fig. 54, $c = AB = 2R \sin AOD = 2R \sin \frac{1}{2}AOB = 2R \sin \gamma$.

$$\cdot \cdot \cdot \frac{c}{\sin \gamma} = 2 R.$$

96. The Square of Any Side of a Triangle is equal to the sum of the squares of the other two sides, diminished by twice the product of the two sides multiplied by the cosine of their included angle.

From geometry we have, in Fig. 55,

$$c^2 = a^2 + b^2 - 2b \cdot DC = a^2 + b^2 - 2ab\cos\gamma$$
. (1)

Also, in Fig. 56,

or

$$c^2 = a^2 + b^2 + 2b \cdot CD = a^2 + b^2 + 2ab \cos \gamma',$$

 $c^2 = a^2 + b^2 - 2ab \cos \gamma.$ (2)

This relation may also be proved as follows:

In Fig. 55,
$$b = AC = AD + DC = c \cos \alpha + a \cos \gamma$$
.
In Fig. 56, $b = AC = AD - CD = c \cos \alpha - a \cos \gamma$

$$= c \cos \alpha + a \cos \gamma$$
.

$$\therefore b = c \cos \alpha + a \cos \gamma.$$

$$\therefore c\cos\alpha = b - a\cos\gamma.$$

$$\therefore c^2 \cos^2 \alpha = a^2 \cos^2 \gamma + b^2 - 2 ab \cos \gamma.$$

But By addition,

$$c^2 \sin^2 \alpha = a^2 \sin^2 \gamma$$
, from (1), Art. 95.

$$c^2 = a^2 + b^2 - 2 ab \cos \gamma,$$

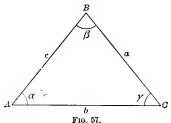

since $\sin^2 x + \cos^2 x = 1$.

97. Case I. Given One Side and Two Angles (a, a, β) .

Formulas:
$$\gamma = 180^{\circ} - (\alpha + \beta);$$

$$b = \frac{a}{\sin \alpha} \sin \beta;$$

$$c = \frac{a}{\sin \alpha} \sin \gamma.$$

- 1. Solve the triangle when a = 3.4356, $a = 17^{\circ} 43'.4$, $\gamma = 60^{\circ} 35'.7$.
 - $\therefore \beta = 180^{\circ} (\alpha + \gamma) = 101^{\circ} 40'.9.$
 - (a) By natural functions.

$$b = a \times \sin \beta \div \sin \alpha = 3.4356 \times .97929 \div .30442 = 11.052.$$

 $c = a \times \sin \gamma \div \sin \alpha = 3.4356 \times .87117 \div .30442 = 9.8318.$

(b) By the use of logarithms.

$$\log b = \log a - \log \sin a + \log \sin \beta = \log a + \cot \sin a + \log \sin \beta.$$
$$\log c = \log a - \log \sin a + \log \sin \gamma = \log a + \cot \sin a + \log \sin \gamma.$$

$$\begin{array}{ll} \log a = 0.53600 & \log a = 0.53600 \\ \cosh \alpha = 0.51652 & \cosh \alpha = 0.51652 \\ \log \sin \beta = 9.99091 & \log \sin \gamma = 9.94010 \\ \log b = 1.04343 & \log c = 0.99262 \\ b = 11.052 & c = 9.8315 \end{array}$$

- 2. Solve the triangle when c = 54.376, $a = 103^{\circ} 3'.2$, $\beta = 40^{\circ} 10'.3$. Ans. $\gamma = 36^{\circ} 46'.5$; b = 58.591; a = 88.478.
- 3. Solve the triangle when a = 0.14323, $a = 53^{\circ} 17'.3$, $\beta = 62^{\circ} 23'.5$.

Ans.
$$\gamma = 64^{\circ} 19'.2$$
; $b = 0.15832$; $c = 0.16101$.

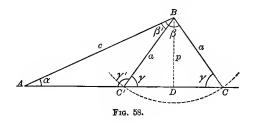

98. Case II. Given Two Sides and the Angle Opposite One of them (a, c, a). — From the sine proportion, we have

$$\sin \gamma = -\frac{c}{a} \sin \alpha. \tag{1}$$

Since γ is found from (1) by means of its sine, it may have two values, one in the first and one in the second quadrant, their sum being 180°. Therefore there may be two triangles with the given elements.

If α is obtuse, γ must be acute, since there can be only one obtuse angle in a plane triangle, and there will be only one solution.

If α is acute, and α is greater than c, γ will be acute, since α must be greater than γ , and there will be only one solution.

If α is acute, and α is equal to c, there will be only one solution, since the points C' and A will coincide.

If α is acute, and α is less than c, γ will be greater than α , and therefore γ may be either in the first or in the second quadrant.

In order that there may be two solutions, the given angle must be acute, and the side opposite it must be less than the side adjacent.

If a = DB, the two triangles will be coincident, γ being 90°. If a is less than DB, the triangle will be impossible; this will be shown in the computation where $\sin \gamma$, found from (1), will be greater than unity.

If we use primed letters to represent the unknown elements of one of the triangles, and unprimed letters for those of the other, we have

Formulas:
$$\sin \gamma = \frac{c}{a} \sin \alpha = \sin \gamma';$$

$$\beta = 180^{\circ} - (\alpha + \gamma); \ \beta' = 180^{\circ} - (\alpha + \gamma');$$

$$b = \frac{a}{\sin \alpha} \sin \beta; \ b' = \frac{a}{\sin \alpha} \sin \beta';$$

$$b = \frac{c}{\sin \gamma} \sin \beta; \ b' = \frac{c}{\sin \gamma'} \sin \beta'.$$

or

1. Solve the triangle when a = 9.4672, c = 14.433, $a = 11^{\circ} 14'.3$.

In this example $\alpha < 90^{\circ}$, a < c; ... two solutions. $\log \sin \gamma = \log c + \cot \alpha + \log \sin \alpha = \log \sin \gamma'$.

$$\beta = 180^{\circ} - (\alpha + \gamma); \ \beta' = 180^{\circ} - (\alpha + \gamma').$$

 $\log b = \log a + \operatorname{col} \sin a + \log \sin \beta = \log c + \operatorname{col} \sin \gamma + \log \sin \beta.$

 $\log b' = \log a + \operatorname{col} \sin a + \log \sin \beta' = \log c + \operatorname{col} \sin \gamma' + \log \sin \beta'.$

- 2. Solve the triangle when $\alpha = 2.4741$, c = 1.0003, $\alpha = 69^{\circ}$ 14'.8. Ans. $\gamma = 22^{\circ}$ 12'.8; $\beta = 88^{\circ}$ 32'.4; b = 2.6449.
- 3. Solve the triangle when $a=10.473,\ b=12.987,\ a=44^{\circ}\,11'.3.$ Ans. $\begin{cases} \beta=59^{\circ}\,48'.5\,;\ \gamma=76^{\circ}\,0'.2\,;\ c=14.579\,;\\ \beta'=120^{\circ}\,11'.5\,;\ \gamma'=15^{\circ}\,37'.2\,;\ c'=4.0456. \end{cases}$

4. Solve the triangle when
$$\alpha = 0.43477$$
, $b = 0.40031$, $\alpha = 94^{\circ} 17'.6$.

Ans. $\beta = 66^{\circ} 39'.6$; $\gamma = 19^{\circ} 2'.8$; $c = 0.14228$.

- 99. Case III. Given the Three Sides (a, b, c).
- (a) From Art. 96,

$$a^2 = b^2 + c^2 - 2 bc \cos \alpha$$
.

$$\bullet \stackrel{\cdot}{\cdot} \cos \alpha = \frac{b^2 + c^2 - a^2}{2bc} \bullet \tag{1}$$

From this equation we may find α by means of its *natural* cosine.

(b) To adapt (1) to logarithmic computation, subtract each member from unity.

$$\therefore 1 - \cos \alpha = 1 - \frac{b^2 + c^2 - a^2}{2bc} = \frac{2bc - b^2 - c^2 + a^2}{2bc} = \frac{a^2 - (b - c)^2}{2bc}$$

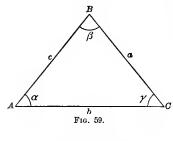

$$\therefore 2\sin^2\frac{1}{2}\alpha = \frac{[a+(b-c)][a-(b-c)]}{2bc} = \frac{(a+b-c)(a-b+c)}{2bc}.$$

$$a+b+c=2 s$$

$$a + b - c = a + b + c - 2 c = 2 s - 2 c = 2(s - c);$$

$$a - b + c = a + b + c - 2 b = 2 s - 2 b = 2(s - b).$$

$$\therefore \sin^2 \frac{1}{2} \alpha = \frac{2(s - b) 2(s - c)}{4 b c} = \frac{(s - b)(s - c)}{b c};$$

where s is half the sum of the three sides, and b and c are the sides adjacent to the angle.

$$\begin{array}{l}
\cdot \cdot \cdot \sin^2 \frac{1}{2} \alpha = \frac{(s-b)(s-c)}{bc}, \\
\sin^2 \frac{1}{2} \beta = \frac{(s-a)(s-c)}{ac}, \\
\sin^2 \frac{1}{2} \gamma = \frac{(s-a)(s-b)}{ab}.
\end{array}$$
(2)

(c) Again, adding each member of (1) to unity,

$$1 + \cos \alpha = 1 + \frac{b^2 + c^2 - a^2}{2 \ bc} = \frac{2 \ bc + b^2 + c^2 - a^2}{2 \ bc} = \frac{(b + c)^2 - a^2}{2 \ bc}.$$

$$\therefore 2\cos^2\frac{1}{2}\alpha = \frac{(b+c+a)(b+c-a)}{2bc} = \frac{2s\cdot 2(s-a)}{2bc}.$$

$$\cos^{2}\frac{1}{2}\alpha = \frac{s(s-a)}{bc},$$

$$\cos^{2}\frac{1}{2}\beta = \frac{s(s-b)}{ac},$$

$$\cos^{2}\frac{1}{2}\gamma = \frac{s(s-c)}{ab}.$$
(3)

(d) Dividing $\sin^2 \frac{1}{2} \alpha$ by $\cos^2 \frac{1}{2} \alpha$, we have

Similarly,
$$\tan^{2}\frac{1}{2}\alpha = \frac{(s-b)(s-c)}{s(s-a)},$$

$$\tan^{2}\frac{1}{2}\beta = \frac{(s-a)(s-c)}{s(s-b)},$$

$$\tan^{2}\frac{1}{2}\gamma = \frac{(s-a)(s-b)}{s(s-c)}.$$

Or
$$\tan^{2}\frac{1}{2}\alpha = \frac{(s-a)(s-b)(s-c)}{s(s-a)^{2}} = \frac{(s-a)(s-b)(s-c)}{s} \cdot \frac{1}{(s-a)^{2}}$$

$$\therefore \tan\frac{1}{2}\alpha = \frac{1}{s-a}\sqrt{\frac{(s-a)(s-b)(s-c)}{s}}.$$
Let
$$r = \sqrt{\frac{(s-a)(s-b)(s-c)}{s}}$$
(5)

Similarly,

$$\tan \frac{1}{2}\alpha = \frac{r}{s-a},$$

$$\tan \frac{1}{2}\beta = \frac{r}{s-b},$$

$$\tan \frac{1}{2}\gamma = \frac{r}{s-c}.$$
(6)

The angles of the triangle may be found from (2), (3), (4), or (5) and (6), the computation being checked by

$$\frac{1}{2}\alpha + \frac{1}{2}\beta + \frac{1}{2}\gamma = 90^{\circ}$$
.

In finding all the angles, (5) and (6) should be used.

Note. — The tabular difference for $\tan x$ is greater than that for either $\sin x$ or $\cos x$, so that a small error in $\tan x$ will affect the angle x less than would a corresponding error in $\sin x$ or $\cos x$. Hence the angles should be determined by means of their tangents whenever practicable.

Again, when x is less than 45° , the tabular difference for $\sin x$ exceeds that for $\cos x$, and when x is greater than 45° , the tabular difference for $\cos x$ is the greater. Hence the angle should be determined by means of its sine rather than its cosine when the angle is less than 45° , and by its cosine rather than its sine when it is greater than 45° .

Note. -r is the radius of the inscribed circle. For, considering the areas,

$$\Delta ABC = \Delta OAC + \Delta OCB + \Delta OBA$$

$$= \frac{AC}{2}OE, + \frac{BC}{2}OF + \frac{AB}{2}OD$$

$$= \frac{1}{2}(AC + BC + AB)r = sr.$$

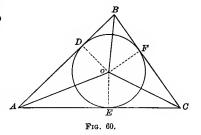

But, from Art. 109,

$$\triangle ABC = \sqrt{s(s-a)(s-b)(s-c)}.$$

$$... sr = \sqrt{s(s-a)(s-b)(s-c)}.$$

$$\sqrt{(s-a)(s-b)(s-c)}$$

$$\therefore r = \sqrt{\frac{(s-a)(s-b)(s-c)}{s}}.$$

1. Solve the triangle when a = 0.0093146, b = 0.0176530, c = 0.0095768.

$$\log r = \frac{1}{2} [\log (s - a) + \log (s - b) + \log (s - c) + \cos s],$$
$$\log \tan \frac{1}{2} a = \log r - \log (s - a), \text{ etc.}$$

$$\begin{array}{llll} a = 0.0093146 & \log (s-a) = 7.95219 - 10 \\ b = 0.0176530 & \log (s-b) = 6.79183 - 10 \\ c = 0.0095768 & \log (s-c) = 7.93929 - 10 \\ 2 s = 0.0365444 & \cos s = 1.73821 \\ s = 0.0182722 & \log r^2 = 4.42152 - 10 \\ s-a = 0.0089576 & \log r = 7.21076 - 10 \\ s-b = 0.0006192 & \cos s = 0.0365444 & \log \tan \frac{1}{2} a = 9.25857 \\ \text{sum} = 0.0365444 & \log \tan \frac{1}{2} \beta = 0.41893 \\ 2 s = 0.0365444 & \log \tan \frac{1}{2} \gamma = 9.27147 \\ a check. & \log \tan \frac{1}{2} \gamma = 9.27147 \\ \frac{1}{2} \gamma = 10^{\circ} 35'.0 \end{array}$$

In finding log $\tan \frac{1}{2}a$, write $\log r$ on the margin of a slip of paper, place it above $\log (s-a)$, and write the difference of the two logarithms opposite $\log \tan \frac{1}{2}a$; then find $\log \tan \frac{1}{2}\beta$ and $\log \tan \frac{1}{2}\gamma$ in the same way. Find s-a, s-b, and s-c in a similar manner.

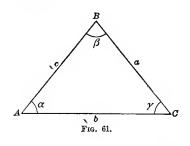

2. Solve the triangle when a = 32.456, b = 41.724, c = 53.987.

Ans.
$$\frac{1}{2}\alpha = 18^{\circ} 27'.4$$
; $\frac{1}{2}\beta = 25^{\circ} 16'.3$; $\frac{1}{2}\gamma = 46^{\circ} 16'.4$.

3. Solve the triangle when a = 0.14679, b = 0.10433, c = 0.04796.

Ans.
$$\frac{1}{2} \alpha = 73^{\circ} 20'.4$$
; $\frac{1}{2} \beta = 11^{\circ} 29'.4$; $\frac{1}{2} \gamma = 5^{\circ} 10'.2$.

100. Case IV. Given Two Sides and the Included Angle (b, c, a). First Method. — The sum of any two sides of a triangle is to their difference as the tangent of half the sum of the opposite angles is to the tangent of half their difference. For we have

$$\frac{b}{c} = \frac{\sin \beta}{\sin \gamma}$$

By composition and division,

$$\frac{b+c}{b-c} = \frac{\sin \beta + \sin \gamma}{\sin \beta - \sin \gamma}$$

$$= \frac{2 \sin \frac{1}{2} (\beta + \gamma) \cos \frac{1}{2} (\beta - \gamma)}{2 \cos \frac{1}{2} (\beta + \gamma) \sin \frac{1}{2} (\beta - \gamma)}.$$
(Art. 73.)

$$\therefore \frac{b+c}{b-c} = \frac{\tan\frac{1}{2}(\beta+\gamma)}{\tan\frac{1}{2}(\beta-\gamma)}.$$
 (1)

But $\beta + \gamma = 180^{\circ} - \alpha$; $\frac{1}{2}(\beta + \gamma) = 90^{\circ} - \frac{1}{2}\alpha$. $\therefore \tan \frac{1}{2}(\beta + \gamma) = \cot \frac{1}{2}\alpha$.

$$\therefore \tan \frac{1}{2} (\beta - \gamma) = \frac{b - c}{b + c} \cot \frac{1}{2} \alpha. \tag{2}$$

From (2) we find $\frac{1}{2}(\beta-\gamma)$; adding $\frac{1}{2}(\beta-\gamma)$ to $\frac{1}{2}(\beta+\gamma)$, we have β , and subtracting $\frac{1}{2}(\beta-\gamma)$ from $\frac{1}{2}(\beta+\gamma)$, we have γ . Then the third side is found from the sine proportion.

Formulas:
$$\tan \frac{1}{2} (\beta - \gamma) = \frac{b - c}{b + c} \cot \frac{1}{2} \alpha,$$

$$\frac{1}{2} (\beta + \gamma) = 90^{\circ} - \frac{1}{2} \alpha,$$

$$\beta = \frac{1}{2} (\beta + \gamma) + \frac{1}{2} (\beta - \gamma),$$

$$\gamma = \frac{1}{2} (\beta + \gamma) - \frac{1}{2} (\beta - \gamma),$$

$$\alpha = \frac{b \sin \alpha}{\sin \beta} = \frac{c \sin \alpha}{\sin \gamma}.$$

In using (1) or (2) the greater side and the greater angle should be written first; thus, if c were greater than b, we should use c-b and $\gamma-\beta$ instead of b-c and $\beta-\gamma$. If the smaller side is written first, the tangent of half the difference of the two angles will be negative, giving the half-difference as an angle between 0° and -90° .

$$\begin{array}{c} b-c=0.02955 \\ b+c=0.25779 \\ \hline \\ log (b-c)=8.47056 \\ col (b+c)=0.58874 \\ log cot \frac{1}{2} \alpha=0.41308 \\ \hline \\ log tan \frac{1}{2} (\beta-\gamma)=16^{\circ} 31^{\prime}.7 \\ \frac{1}{2} (\beta+\gamma)=68^{\circ} 52^{\prime}.7 \\ \beta=85^{\circ} 24^{\prime}.4 \\ \gamma=52^{\circ} 21^{\prime}.0 \\ \hline \end{array} \begin{array}{c} log b=9.15737 \\ log sin \alpha=9.82755 \\ col sin \beta=0.00140 \\ log \alpha=8.98632 \\ \alpha=0.096900 \\ log c=9.05737 \\ log sin \alpha=9.82755 \\ col sin \gamma=0.10141 \\ log \alpha=8.98633 \\ \alpha=0.096902 \\ \hline \end{array}$$

- 2. Solve the triangle when a=101.47, c=99.367, $\beta=47^{\circ}$ 48'.2. Ans. $\alpha=67^{\circ}$ 27'.1; $\gamma=64^{\circ}$ 44'.7; b=81.396 or 81.394.
- 3. Solve the triangle when b = 19.937, c = 62.475, $\alpha = 130^{\circ}$ 9'.4. Ans. $\beta = 11^{\circ}$ 26'.1; $\gamma = 38^{\circ}$ 24'.5; $\alpha = 76.858$ or 76.860.
- 101. Case IV. Given b, c, a. Second Method. To prove the equations

$$\begin{array}{l}
a \sin \frac{1}{2}(\beta - \gamma) = (b - c) \cos \frac{1}{2} \alpha, \\
a \cos \frac{1}{2}(\beta - \gamma) = (b + c) \sin \frac{1}{2} \alpha.
\end{array} (1)$$

$$\frac{b}{c} = \frac{\sin \beta}{\sin \gamma} \cdot \cdot \cdot \cdot \frac{b+c}{c} = \frac{\sin \beta + \sin \gamma}{\sin \gamma}.$$

$$\cdot \cdot \frac{b+c}{\sin \beta + \sin \gamma} = \frac{c}{\sin \gamma} = \frac{a}{\sin \alpha} = \frac{a}{\sin (\beta + \gamma)}.$$

$$\cdot \cdot \frac{b+c}{2 \sin \frac{1}{2}(\beta + \gamma) \cos \frac{1}{2}(\beta - \gamma)} = \frac{a}{2 \sin \frac{1}{2}(\beta + \gamma) \cos \frac{1}{2}(\beta + \gamma)}.$$

$$\cdot \cdot \cdot a \cos \frac{1}{2}(\beta - \gamma) = (b+c) \cos \frac{1}{2}(\beta + \gamma)$$

$$= (b+c) \sin \frac{1}{2} \alpha. \qquad Q.E.D.$$
Similarly,
$$\frac{b-c}{c} = \frac{\sin \beta - \sin \gamma}{\sin \gamma} \text{ reduces to}$$

$$a \sin \frac{1}{2}(\beta - \gamma) = (b-c) \sin \frac{1}{2}(\beta + \gamma) = (b-c) \cos \frac{1}{2} \alpha.$$
1. Solve the triangle when $b = 0.14367$, $c = 0.11412$, $a = 42^{\circ}14'.6$.
$$b-c = 0.02955 \quad (1) \quad (4)+(6) = \log \left[a \sin \frac{1}{2}(\beta - \gamma)\right] = 8.44036 \quad (8)$$

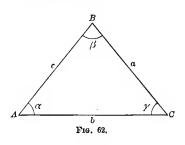

$$b+c = 0.25779 \quad (2) \qquad \log \sin \frac{1}{2}(\beta - \gamma) = 9.45404 \quad (12)$$

$$\frac{1}{2} a = 21^{\circ}7'.3 \quad (3) \qquad \log \cos \frac{1}{2}(\beta - \gamma) = 9.98167 \quad (12)$$

$$(8-12)=(9)-(12)=\log a = 8.98632$$
 (13)
 $a = 0.096900$ (17)

- 2. Solve the triangle when $b=2.3671,\ c=1.4345,\ \alpha=112^{\circ}\,43'.4.$ Ans. $\beta=42^{\circ}\,54'.5$; $\gamma=24^{\circ}\,22'.1$; $\alpha=3.2069.$
- 3. Solve the triangle when $a=101.47,\ c=99.367,\ \beta=47^{\circ}\ 48'.2.$ Ans. $\alpha=67^{\circ}\ 27'.1$; $\gamma=64^{\circ}\ 44'.7$; b=81.396.

102. Case IV. Given b, c, a. Third Method. — To find the third side only.

$$a^{2} = b^{2} + c^{2} - 2 bc \cos \alpha.$$
But
$$\cos \alpha = 1 - 2 \sin^{2} \frac{1}{2} \alpha.$$

$$\therefore a^{2} = b^{2} + c^{2} - 2 bc + 4 bc \sin^{2} \frac{1}{2} \alpha$$

$$= (b - c)^{2} + 4 bc \sin^{2} \frac{1}{2} \alpha$$

$$= (b - c)^{2} \left[1 + \frac{4 bc \sin^{2} \frac{1}{2} \alpha}{(b - c)^{2}} \right].$$

$$\therefore a = (b - c) \sqrt{1 + \frac{4 bc \sin^{2} \frac{1}{2} \alpha}{(b - c)^{2}}}.$$

Let x be an angle such that

$$\tan^2 x = \frac{4 bc \sin^2 \frac{1}{2} \alpha}{(b-c)^2};$$

$$\tan x = \frac{2 \sin \frac{1}{2} \alpha}{b-c} \sqrt{bc}.$$
(1)

 \mathbf{or}

This assumption is possible, since the value of the second member of (1) must lie between $+\infty$ and $-\infty$, so that there will always be some angle whose tangent is equal to this quantity.

$$\therefore a = (b - c)\sqrt{1 + \tan^2 x} = (b - c)\sec x;$$

$$a = \frac{b - c}{\cos x}.$$
(2)

or

First find x from (1), and then a from (2). In these equations b-c is replaced by c-b when c>b.

1. Find a when c = 1.4345, b = 2.3671, and $a = 112^{\circ} 43'.4$.

 $\log \tan x = \frac{1}{2} (\log b + \log c) + \log 2 + \log \sin \frac{1}{2} a + \cot (b - c).$ $\log a = \log (b - c) - \log \cos x.$

$$\log b = 0.37422 \qquad \log (b-c) = 9.96970$$

$$\log c = 0.15670 \qquad -\log \cos x = 9.46361$$

$$\log bc = 0.53092 \qquad \log a = 0.50609$$

$$\log \sqrt{bc} = 0.26546 \qquad a = 3.2069$$

$$\log \sin \frac{1}{2} a = 9.92041$$

$$\cot (b-c) = 0.03030$$

$$\log \tan x = 0.51720$$

2. Find b when a = 101.47, c = 99.367, $\beta = 47^{\circ} 48'.2$.

 $x = 73^{\circ} 5'.6$

 $x = 88^{\circ} 31'.17$; b = 81.396.

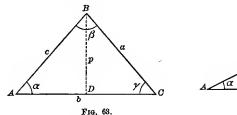

3. Find a when b = 19.937, c = 62.475, $a = 130^{\circ} 9'.4$.

 $x = 56^{\circ} 23'.7$; a = 76.858.

OBLIQUE TRIANGLES SOLVED BY RIGHT TRIANGLES.

103. Case I. Given a, α , γ . — In Figs. 63 and 64, on the next page, draw DB perpendicular to AC. Considering the first figure, in the triangle BDC we know a and γ , and we compute DB and DC; then in the triangle BDA we know DB and a, and we compute AD and c; then b = AD + DC,

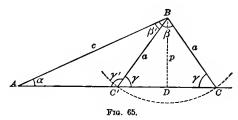

completing the solution. In the second figure, where γ is obtuse, we know, in the triangle BDC, a and $DCB = 180^{\circ} - \gamma$, and we compute DB and CD; then in the triangle BDA we know DB and α , and we compute c and AD; then b = AD - CD, completing the solution.

- 1. Solve the triangle when a=3.4356, $\alpha=17^{\circ}$ 43'.4, $\gamma=60^{\circ}$ 35'.7. \therefore $\beta=101^{\circ}$ 40'.9; DC=1.6868; DB=2.9929; AD=9.3650; c=9.8315; b=11.0518.
- 2. Solve the triangle when $a=54.376, \ \gamma=103^{\circ}\,3'.2, \ \beta=40^{\circ}\,10'.3.$ Ans. $\alpha=36^{\circ}\,46'.5$; c=88.478; b=58.592.
- 3. Solve the triangle when $c=230.47,~\alpha=21^{\circ}\,32'.2,~\beta=36^{\circ}\,24'.4.$ Ans. $\gamma=122^{\circ}\,3'.4~;~\alpha=99.825~;~b=161.3975.$

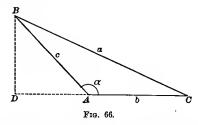

104. Case II. Given a, c, a.—In the right triangle ADB we know c and a, and we compute AD and DB; then in the triangle CBD we know DB and a, and we find DC and γ ; then

$$b = AD + DC$$
; $\beta = 180^{\circ} - (\alpha + \gamma)$;
 $b' = AD - DC$; $\gamma' = 180^{\circ} - \gamma$; $\beta' = 180^{\circ} - (\alpha + \gamma')$.

Two solutions are possible only when α is acute and α is less than c and greater than DB.

If α is obtuse, as in Fig. 66, we solve first the triangle BAD, then the triangle BCD, and find b = DC - DA.

1. Solve the triangle when c = 23.647, a = 14.135, $\alpha = 33^{\circ} 17'.3$.

$$AD = 19.767 \; ; \; DB = 12.979 \; ; \; \gamma = 66^{\circ} \, 40'.0 \; ; \; DC = 5.5986 \; ;$$

$$Ans. \; \begin{cases} \gamma = 66^{\circ} \, 40'.0 \; ; \; \beta = 80^{\circ} \, \ 2'.7 \; ; \; b = 25.3656 \; ; \\ \gamma' = 113^{\circ} \, 20'.0 \; ; \; \beta' = 33^{\circ} \, 22'.7 \; ; \; b' = 14.1684. \end{cases}$$

- 2. Solve the triangle when a = 2.4741, c = 1.0003, $\alpha = 69^{\circ} 14^{\prime}.8$.
- $\therefore \gamma = 22^{\circ} 12'.8$; $\beta = 88^{\circ} 32'.4$; AD = 0.35445; DC = 2.2905; b = 2.64495.
 - 3. Solve the triangle when a = 10.473, b = 12.987, $\alpha = 44^{\circ} 11'.3$.

Ans.
$$\begin{cases} \beta = 59^{\circ} 48'.5; \ \gamma = 76^{\circ} \ 0'.2; \ c = 14.5793; \\ \beta' = 120^{\circ} 11'.5; \ \gamma' = 15^{\circ} 37'.2; \ c' = 4.0455. \end{cases}$$

4. Solve the triangle when a = 0.43477, b = 0.40031, $\alpha = 94^{\circ} 17'.6$.

Ans. $\beta = 66^{\circ} 39'.6$; $\gamma = 19^{\circ} 2'.8$; c = 0.142282.

105. Case III. Given
$$a$$
, b , c .— In Fig. 63,
$$p^2 = c^2 - AD^2; \ p^2 = a^2 - DC^2.$$
$$\therefore c^2 - AD^2 = a^2 - DC^2.$$
$$\therefore AD^2 - DC^2 = c^2 - a^2.$$
$$\therefore AD - DC = \frac{(c+a)(c-a)}{AD + DC} = \frac{(c+a)(c-a)}{b},$$

from which AD - DC may be computed. Then

$$AD = \frac{1}{2} [b + (AD - DC)],$$

$$DC = \frac{1}{2} [b - (AD - DC)].$$

and

If either AD or DC is negative, it is exterior to the triangle; that is, the point D is on the line AC produced.

Having found AD and DC, the angles are found from the right triangles DBA and DBC.

- 1. Solve the triangle when a = 27.103, b = 16.432, c = 12.511.
- c a = -14.592; AD DC = -35.178; AD = -9.373; DC = 25.805.

Ans. $\alpha = 138^{\circ} 31'.2$; $\gamma = 17^{\circ} 48'.5$; $\beta = 23^{\circ} 40'.3$.

In this example D lies to the left of A.

2. Solve the triangle when a = 32.456, b = 41.724, c = 53.987.

$$AD - DC = 44.607$$
; $AD = 43.1655$; $DC = -1.4415$.

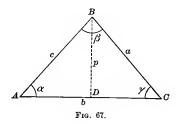

Ans. $\alpha = 36^{\circ} 54'.7$; $\gamma = 92^{\circ} 32'.7$; $\beta = 50^{\circ} 32'.6$.

3. Solve the triangle when a = 0.14679, b = 0.10433, c = 0.04796.

$$AD - DC = -0.18448$$
; $AD = -0.040075$; $DC = +0.144405$.

Ans. $\alpha = 146^{\circ} 40'.75$; $\gamma = 10^{\circ} 21'.0$; $\beta = 22^{\circ} 58'.25$.

106. Case IV. Given b, c, a. — In the triangle ADB, knowing c and a, find AD and DB. Then in the triangle DBC we know DB and DC = b - AD, so that we can compute a and γ .

1. Solve the triangle when b = 1143.7, c = 1822.4, $a = 15^{\circ} 6'.4$.

$$AD = 1759.5$$
; $DB = 474.96$; $DC = -615.8$.

Ans. $\gamma = 142^{\circ} 21'.5$; a = 777.68; $\beta = 22^{\circ} 32'.1$.

The negative value of DC shows that D is to the right of C.

2. Solve the triangle when b = 19.937, c = 62.475, $\alpha = 130^{\circ} 9'.4$.

$$\therefore AD = -40.288$$
; $DC = 60.225$.

Ans.
$$\gamma = 38^{\circ} 24'.5$$
; $\beta = 11^{\circ} 26'.1$; $\alpha = 73.857$, or 76.858.

Note that a is obtuse.

3. Solve the triangle when a = 101.47, c = 99.367, $\beta = 47^{\circ} 48'.2$.

Ans.
$$\gamma = 64^{\circ} 44'.6$$
; $\alpha = 67^{\circ} 27'.2$; $b = 81.394$.

AREAS OF TRIANGLES.

107. Given Two Sides and the Included Angle (b, c, a). Represent the area by A. From geometry, in Fig. 67,

$$A = \frac{1}{2} pb.$$

$$p = c \sin \alpha.$$

$$\therefore A = \frac{1}{2} bc \sin \alpha,$$
(1)

Bnt

or, the area of a triangle is equal to half the product of the two sides multiplied by the sine of their included angle.

108. Given One Side and the Three Angles $(b, \alpha, \beta, \gamma)$. Substitute in (1), Art. 107, the value of c found from the sine proportion,

 $c = \frac{b \sin \gamma}{\sin \beta},$

giving

$$A = \frac{b^2}{2} \cdot \frac{\sin \alpha \sin \gamma}{\sin \beta}.$$
 (1)

Given the Three Sides (a, b, c). — We have

$$A = \frac{1}{2}bc \sin \alpha = bc \sin \frac{1}{2}\alpha \cos \frac{1}{2}\alpha.$$

From (2) and (3), Art. 99, we have

$$A = bc\sqrt{\frac{(s-b)(s-c)}{bc}}\sqrt{\frac{s(s-a)}{bc}} = \sqrt{s(s-a)(s-b)(s-c)}. \quad (1)$$

110. Given Two Sides and the Angle Opposite One of them (b, c, β) .—First find γ by the formula

 $\sin \gamma = \frac{c}{\lambda} \sin \beta.$

Then

$$\alpha = 180^{\circ} - (\beta + \gamma),$$

and

$$A = \frac{1}{2} bc \sin \alpha.$$

EXAMPLES.

1. Find the area when b = 0.14367, c = 0.11412, $\alpha = 42^{\circ} 14'.6$.

 $\log b = 9.15737$

 $\log c = 9.05737$

 $\log \sin \alpha = 9.82755$ col 2 = 9.69897

 $\log A = 7.74126$

A = 0.0055114

2. Find the area when a = 3.4356, $\alpha = 17^{\circ} 43'.4, \ \gamma = 60^{\circ} 35'.7.$

...
$$\beta = 101^{\circ} 40'.9$$
.

 $\log a^2 = 2 \log a = 1.07200$ col 2 = 9.69897

 $\log \sin \beta = 9.99091$

 $\log \sin \gamma = 9.94010$

col sin a = 0.51652

 $\log A = 1.21850$ A = 16.539

3. Find the area when a = 0.0093146, b = 0.0176530, c = 0.0095768.

2s = 0.0365444

s = 0.0182722

s-a=0.0089576

s-b=0.0006192

s-c=0.0086954

sum = 0.0365444

a check.

 $\log s = 8.26179$

 $\log(s-a) = 7.95219$

 $\log(s-b) = 6.79183$

 $\log(s-c) = 7.93929$

2)10.94510 - 20

 $\log A = 5.47255 - 10$

A = 0.000029686

4. Find the area when a = 9.4672, c = 14.433, $a = 11^{\circ} 14'.3$.

$\log c = 1.15936$	$\log a = 0.97622$	$\log a = 0.97622$
$\log \sin \alpha = 9.28979$	$\log c = 1.15936$	$\log c = 1.15936$
$\cot a = 9.02378$	col 2 = 9.69897	col 2 = 9.69897
$\log \sin \gamma = \overline{9.47293}$	$\log \sin \beta = 9.67899$	$\log \sin \beta' = 9.02259$
$\gamma = 17^{\circ} 17'.1$	$\log A = 1.51354$	$\log A' = 0.85714$
$\gamma' = 162^{\circ} 42'.9$	A = 32.624	A' = 7.1968
$\beta = 151^{\circ} 28'.6$		
$\beta' = 6^{\circ} 2'.8$		

Note that $\log A$ and $\log A'$ can be found by adding $\log \sin \beta$ and $\log \sin \beta'$ respectively to $\log \alpha + \log c + \cos 2$, a shorter method than that given in this example.

5. Find the area when a = 0.013456, b = 0.023678, $a = 40^{\circ} 31'.4$.

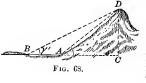

Ans. 0.00010351.

- 6. Find the area when c = 43.145, $a = 40^{\circ} 40^{\prime}.3$, $\beta = 60^{\circ} 30^{\prime}.3$. Ans. 538.19.
- 7. Find the area when a = 1.4142, b = 1.6735, c = 2.8533. Ans. 0.83826.
- 8. Find the area when a = 14.135, c = 23.647, $a = 33^{\circ} 17'.3$.

Ans. 164.61 or 91.948.

111. Illustrative Examples. — The bearing of a line is the angle it makes with the magnetic meridian, shown by the magnetic needle. The letter indicating whether the line is measured north or south of the point of beginning is written, then the number of degrees and minutes in the angle, and then the letter indicating whether the line lies to the east or to the west of the magnetic meridian. Thus, if the bearing of the line A is S. 60° W., the line is measured from A to the west of set by an angle of 60°.

The distances and the angles given in the examples are horizontal unless otherwise specified.

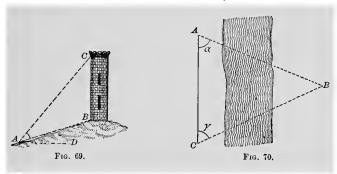

1. From a point on a horizontal plane the angle of elevation to the top of a crag is 40° 28'.6, and 4163.2 feet farther away in the same vertical plane the angle is 28° 50'.4. Find the distances from the points to the top of the crag, and its height above the horizontal plane.

... BD = 13399 feet; AD = 9956.2 feet; CD = 6463.0 feet; BC = 11737 feet; AC = 7573.2 feet.

2. A tower 160.43 feet high is situated at the top of a hill (Fig. 69); 600 feet down the hill the angle between the surface of the hill and a line to the top of the tower is 8° 40'.4. Find the distance to the top of the tower, and the inclination of the ground to a horizontal plane.

...
$$ABC = 136^{\circ} 59'.7$$
; $AC = 725.60$ feet; $DAB = 46^{\circ} 59'.7$.

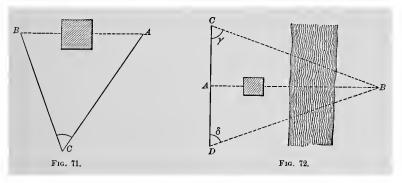

3. To find the horizontal distance from a point A to an inaccessible point B (Fig. 70), the horizontal distance AC and the angles a and γ were measured and found to be 1042.3 feet, 72° 9'.4, and 14° 13'.7, respectively.

$$AB = 256.69 \text{ feet}$$
; $CB = 994.15 \text{ feet}$.

4. To find the distance between two points A and B not visible from each other (Fig. 71).—Select a third point C from which A and B are visible, and measure the distances CA = 444.38 feet, CB = 222.76 feet, and the angle $ACB = 17^{\circ} 17'.6$.

Ans. AB = 240.97 feet.

5. To find the distance from a point A to another point B, the latter being inaccessible and invisible from A (Fig. 72). — Select two points C and D so that C, A, and D shall be in the same straight line, A and B being visible both from C and from D. From measurement it is found that CA = 456.72 feet, AD = 490.74 feet, $\gamma = 71^{\circ}22^{\prime}.7$, $\delta = 36^{\circ}19^{\prime}.4$.

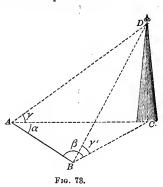

..
$$CB = 589.10$$
 feet; $DB = 942.475$ feet; $AB = 619.51$, or 619.53 feet. CROCK. TRIG. — 8

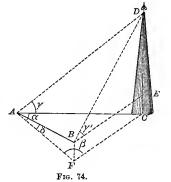

114

6. To find the elevation of the top of a church steeple D (Fig. 73) above the horizontal plane ACB, and the distances of the steeple from A and B. - Let the horizontal distance AB = 435.53 feet, the horizontal angles $a = 140^{\circ} 40'.2$ and $\beta = 10^{\circ}$ 7'.6, and the vertical angles $\gamma = 32^{\circ}$ 45'.6 and $\gamma' = 10^{\circ}$ 7'.3.

AC = 156.95 feet; BC = 565.74 feet; CD = 100.99, or 101.00 feet.

The agreement of the values of CD is a check upon the observed angles and upon the computations.

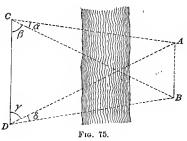

7. To find the elevation of the top of a church steeple D (Fig. 74) above the two points A and B, not in the same horizontal plane, the inclined distance from A to B, and its angle of inclination δ to a horizontal plane being measured, as well as the angles α , β , γ , and γ' , shown in the preceding example. — Let AB=134.70 feet, $\delta=3^{\circ}2'.7$, $\alpha=43^{\circ}14'.8$, $\beta=63^{\circ}17'.5$, $\gamma=56^{\circ}36'.6$, $\gamma'=62^{\circ}17'.3$.

[First find the horizontal distance AF and the vertical distance FB in the right triangle AFB; then solve the horizontal triangle AFC; and then find CDand ED from the right triangles ACD and BED respectively.]

...
$$AF = 134.51$$
 feet; $FB = 7.1553$ feet; $FC = BE = 96.135$ feet; $AC = 125.34$ feet; $CD = 190.17$ feet; $ED = 183.02$ feet. Check: $CD = FB + ED$.

8. To find the distance between two inaccessible points A and B.-Select two points C and D from which both A and B can be seen, and measure

$$CD = 456.32$$
 feet, $\alpha = 30^{\circ} 40'.6$, $\beta = 40^{\circ} 14'.8$, $\gamma = 35^{\circ} 16'.4$, $\delta = 56^{\circ} 47'.4$.

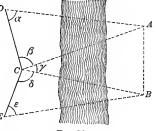

..
$$AD=449.09$$
 feet; $AC=274.41$ feet; $BD=398.66$ feet; $BC=616.66$ feet; $AB=405.57$, or 405.58 feet.

9. To find the distance between two inaccessible points A and B, both being visible from only one accessible point

C.—Select a point D from which A and C are visible, and another point E from which B and C are visible. From measurement

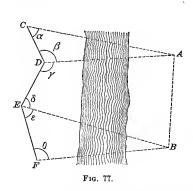

$$CD$$
=943.37 feet, CE =673.33 feet, α = 72° 9′.3, β = 60° 17′.9, γ = 32° 14′.6, δ = 67° 33′.9, ϵ = 19° 14′.7.

...
$$CA = 1217.0$$
 feet; $CB = 222.28$ feet; $AB = 1035.8$ feet.

Frg. 76

10. To find the distance between two inaccessible points A and B, there being no accessible point from which both A and B are visible (Fig. 77). — Select the points C, D, E, and F so that A, C, and E shall be visible from D, and D, F, and B from E. Measure the angles a, β , γ , δ , ϵ , and θ , and the distances CD, DE, and EF. Show how AB may be found from the data thus obtained.

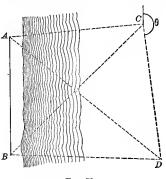

Fig. 78,

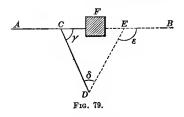

11. Two points A and B, 8763.6 feet apart (Fig. 78), are situated at the sea level in the same north and south line; a vessel is seen at C, and an hour later at D. The required quantities are AC, BC, AD, BD, CD, and the angle that CD makes with the north and south line, having measured $BAC = 120^{\circ} 30'.6$, $BAD = 30^{\circ} 14'.4$, $ABC = 40^{\circ} 18'.8$, $ABD = 140^{\circ} 28'.2$.

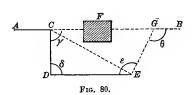

$$AC = 17260 \text{ feet}; \quad BC = 22985 \text{ feet}; \quad AD = 34552.5 \text{ feet}; \quad BD = 27340 \text{ feet}; \\ ACD = 63^{\circ} 14'.5; \quad ADC = 26^{\circ} 29'.3; \quad BCD = 44^{\circ} 3'.8; \quad BDC = 35^{\circ} 46'.8; \\ CD = 38696, \quad 38697, \text{ or } 38699 \text{ feet}; \\ \theta = 360^{\circ} - BAC - ACB - BCD = 176^{\circ} 15'.0, \\ \text{or } = ABD + BDA + ADC = 176^{\circ} 11'.9.$$

12. In measuring the line from A to B, whose direction was known, it was necessary to pass an obstacle at F (Fig. 79). A distance CD = 144.31 feet was measured, making an angle $\gamma = 19^{\circ} 53'.4$ with AB, and the angle $\delta = 140^{\circ} 10'.3$

was laid off with the transit. It is required to find the distance DE to the line, the distance CE, and the angle ϵ , in order that the line AC may be prolonged.

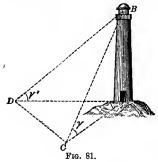

Ans. CE = 271.06 feet; DE = 143.98 feet; $\epsilon = 160^{\circ} 3'.7$.

13. In passing an obstacle at F it was necessary to use the broken line CDEG (Fig. 80). The distances CD and DE and the angles γ , δ , and ϵ were measured. It is required to find the distance EG to the line AB, the distance CG, and the angle θ , when CD=100.37 feet, DE=94.367 feet, $\gamma=80^\circ$,

 $\delta = 101^{\circ} 19'.8$, and $\epsilon = 110^{\circ}$.

14. From the top of a lighthouse AB, 200 feet above the sea level, the angle of depression to a ship was $\gamma=10^{\circ}$ 14'.3; an hour later it was $\gamma'=11^{\circ}$ 10'.6; the horizontal angle between the directions of the ship at the two instants was $\alpha=127^{\circ}$ 14'.4. Find the distance sailed by the ship.

...
$$AC = 1107.3$$
 feet; $AD = 1012.2$ feet; $CD = 1899.3$ feet.

Ans. $ABC = 95^{\circ} 51'.8$, or $95^{\circ} 51'.9$.

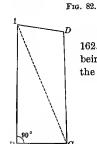

Fig. 83.

16. The sides of a city block measured AB = 423.24, BC = 162.36, CD = 420.81, and DA = 160.62 feet, the first two sides being perpendicular to each other. Find the angles between the other sides.

$$AC = 453.31$$
 feet; $BCA = 69^{\circ}$ 0'.8; $BAC = 20^{\circ} 59'.2$; $ACD = 20^{\circ} 45'.0$; $CAD = 68^{\circ}$ 8'.8; $CDA = 91^{\circ}$ 6'.4; $BCD = 89^{\circ} 45'.8$; $BAD = 89^{\circ}$ 8'.0.

17. A ship B is 12 miles S. 45° W. of a lighthouse A, and sails S. 50° E. to C, a distance of 15 miles. Find its distance from the lighthouse.

Ans. AC = 18.374, or $18.37\overline{5}$ miles.

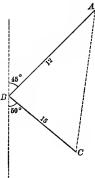

Fig. 84.

18. In surveying a field a thick wood prevents the measurement of the

angle ABD and of the distance BD. The angle $ABC = 70^{\circ} 14'.6$ is measured, a line BC is run 743.86 feet, the angle BCD is found to be 62° 14'.4, and the distance CD to be 912.82 feet.

... $CBD = 68^{\circ} 28'.1$; $CDB = 49^{\circ} 17'.5$; BD = 868.34, 868.36, or 868.38 feet;

 $ABD = 138^{\circ} 42'.7.$

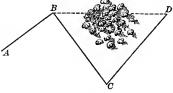

Fig. 85.

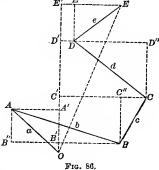

19. The distance OE and its bearing E'OE are required, the engineer having measured the distances a, b, c, d, and e and their respective bearings, N. 30° W., S. 60° E., N. 20° E., N. 40° W., and N. 50° E.

$$\begin{split} OE' &= OA' - B'A' + B'C' + C'D' + D'E' \\ &= a\cos 30^\circ - b\cos 60^\circ + c\cos 20^\circ \\ &+ d\cos 40^\circ + e\cos 50^\circ. \end{split}$$

$$\begin{split} E'E &= -AA' + B''B + C''C - DD'' + E''E \\ &= -a\sin 30^{\circ} + b\sin 60^{\circ} + c\sin 20^{\circ} \\ &- d\sin 40^{\circ} + e\sin 50^{\circ}. \end{split}$$

Then
$$OE \cos E'OE = OE'$$
, $OE \sin E'OE = E'E$;

whence OE and E'OE can be found. Then the quadrant of E'OE fixes the direction of

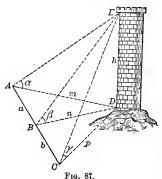

the line OE; thus, if $E'OE=40^\circ$, the bearing is N. 40° E.; if $E'OE=110^\circ$, the bearing is S. 70° E.; if $E'OE=230^\circ$, the bearing is S. 50° W.; if $E'OE=310^\circ$, the bearing is N. 50° W.

20. At a certain point the angles of elevation of the base of a vertical tower and of its top are α and β respectively, the height of the tower being h feet. Prove that the horizontal distance from the point to the tower is

 $h\cos a\cos \beta \csc(\beta-a)$, and that the elevation of its top above the point is $h\cos a\sin \beta \csc(\beta-a)$.

- 21. At the top of a vertical tower whose height is h, the angles of depression to two points M and N in the same vertical plane with the tower were α and β respectively $(\beta > \alpha)$, the points being in the same horizontal plane with the base of the tower. Prove that the distance MN is $h \sin (\beta \alpha) \csc \alpha \csc \beta$.
 - 22. Two points M and N in a horizontal plane are in the same vertical plane

with a tower. The angle of elevation of the top of the tower from M is α , and from N it is β , β being greater than α . Prove that the horizontal distance of the tower from N is $MN \sin \alpha \cos \beta \csc (\beta - \alpha)$.

23. Three points, A, B, and C, are in the same horizontal line, the distances AB and BC being a and b feet respectively (Fig. 87). The angles of elevation of the top of a tower measured at A, B, and C were a, a, and a respectively. Find the elevation of the top of the tower above the horizontal plane through the points, and the horizontal distances of the tower from the three points.

$$m = h \cot \alpha; \ n = h \cot \beta; \ p = h \cot \gamma;$$

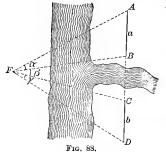

$$m^2 = a^2 + n^2 - 2 \ an \cos ABD;$$

$$p^2 = b^2 + n^2 + 2 \ bn \cos ABD;$$

$$\therefore \frac{a^2 + n^2 - m^2}{2 \ an} = \frac{p^2 - b^2 - n^2}{2 \ bn};$$

$$\therefore h^2 = \frac{ab \ (a + b)}{a \ (\cot^2 \gamma - \cot^2 \beta) + b \ (\cot^2 a - \cot^2 \beta)}$$

24. In Fig. 88 the distances a and b and the angles a, β , and γ are known, and the distance BC = x is required, ABCD being an inaccessible straight line.

$$\frac{a}{\sin \alpha} = \frac{FB}{\sin A}; \quad \frac{a+x}{\sin(\alpha+\beta)} = \frac{FC}{\sin A};$$

$$\therefore \frac{FB}{FC} = \frac{a}{a+x} \cdot \frac{\sin(\alpha+\beta)}{\sin \alpha}.$$
 (1)

$$\frac{b}{\sin \gamma} = \frac{FC}{\sin D}; \quad \frac{b+x}{\sin (\beta + \gamma)} = \frac{FB}{\sin D};$$

$$\therefore \frac{FC}{FB} = \frac{b}{b+x} \cdot \frac{\sin (\beta + \gamma)}{\sin \gamma}.$$
 (2)

Multiplying (1) and (2), we have

$$(a+x)(b+x)\sin a \sin \gamma = ab\sin (a+\beta)\sin (\beta+\gamma),$$

from which x may be found, since the equation is a quadratic in x.

25. Two points A and B in the same vertical plane with the top of a tower

are on a sidehill whose angle of inclination to a horizontal plane is δ , the inclined distance ABbeing a feet. The angles of elevation of the top of the tower were measured at A and B, and found to be α and β . Prove that the horizontal distance of the top of the tower from B is

 $a(\cos\delta\tan\alpha-\sin\delta)\cos\alpha\cos\beta\csc(\beta-\alpha)$, and that the elevation of the top above B is $a(\cos\delta\tan\alpha-\sin\delta)\cos\alpha\sin\beta\csc(\beta-\alpha)$.

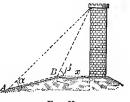

Fig. 89.

- 26. In a hydrographical survey, the distances between three points, A, B, and C_1 , on the shore having been determined, the observer in the boat P measures the angles δ and ϵ subtended by AB and BC. It is required to find the distances of the boat from the three points.
 - (1) Graphical Solution. Construct on AB the segment of a circle APB

that shall contain the measured angle δ , and on BC the segment of a circle BPC that shall contain the angle e. Their point of intersection P will be the position of the boat. There are four possible solutions, only one being shown in the figure.

(2) Analytical Solution.—Let ADCP be the circle through A, C, and P. Then $DAC = \epsilon$, and $DCA = \delta$. Hence in the triangle ADC we know one side AC and the three angles; find AD and CD. In the triangle ABC we know the three sides; find the three angles. In the triangle DAB we

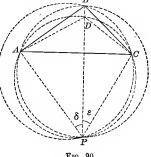

Fig. 90.

know two sides and the angle DAB = CAB - CAD; find ABD. Then in the triangle ABP we know one side and the three angles; find AP and BP. Also, compute DBC from the triangle DCB, and then BP and CP from the triangle BPC. The values of BP should agree.

In the following examples find the last three elements, the first three being given:

27.
$$a = 1.0431$$
, $\beta = 4^{\circ} 4'.4$, $\gamma = 22^{\circ} 3'.6$.
 $\therefore \alpha = 153^{\circ} 52'.0$; $b = 0.16822$; $c = 0.88942$.

28.
$$a = 103.37$$
, $\alpha = 10^{\circ} 11'.3$, $\beta = 83^{\circ} 43'.6$.
 $\therefore \gamma = 86^{\circ} 5'.1$; $b = 580.89$; $c = 583.02$.

29.
$$c=74.344$$
, $\alpha=105^{\circ}\,6'.7$, $\beta=60^{\circ}\,14'.4$.
 $\therefore \ \gamma=14^{\circ}\,38'.9$; $\alpha=283.82$; $b=255.21$.

30.
$$c = 0.047365$$
, $\beta = 40^{\circ} 7'.7$ $\gamma = 39^{\circ} 41'.9$.
 $\therefore \alpha = 100^{\circ} 10'.4$; $\alpha = 0.072990$; $b = 0.047792$.

31.
$$c = 4.4479$$
, $\alpha = 11^{\circ} 11'.3$, $\gamma = 57^{\circ} 37'.4$.
 $\therefore \beta = 111^{\circ} 11'.3$; $\alpha = 1.0219$; $b = 4.9106$.

```
32. b = 143.97, \beta = 30^{\circ} 36'.8, \gamma = 107^{\circ} 15'.5.
                                   ... \ a = 42^{\circ} 7'.7;
                                                             a = 189.64; c = 269.98.
33. b = 10.467, c = 1.4321, \beta = 114^{\circ} 10'.3.
                                                             a = 58^{\circ} 39'.5; a = 9.79875.
                                   \gamma = 7^{\circ} 10'.2;
34. a = 0.67375, b = 0.43213, \alpha = 147^{\circ} 11'.3.
                                   \beta = 20^{\circ} 20'.2; \gamma = 12^{\circ} 28'.5; c = 0.26858.
35. a = 1.4742, c = 0.97674, \alpha = 25^{\circ} 19'.9.
                                   \therefore \gamma = 16^{\circ} 28'.1; \quad \beta = 138^{\circ} 12'.0; \quad b = 2.2966.
36. a = 943.42, b = 647.15, \alpha = 104^{\circ} 6'.9.
                                   ... \beta = 41^{\circ} 42'.0; \gamma = 34^{\circ} 11'.1; c = 546.59.
37. a = 0.10321, c = 0.047323, \alpha = 45^{\circ} 9'.7.
                                   \therefore \gamma = 18^{\circ} 58'.4; \beta = 115^{\circ} 51'.9; b = 0.13097.
38. a = 4.4321, c = 5.4763, \gamma = 100^{\circ} 11'.9.
                                   \alpha = 52^{\circ} 48'.1; \beta = 27^{\circ} 0'.0; \beta = 2.5261.
39. c = 23.111, b = 19.476, \gamma = 47^{\circ} 16'.7.
                                   \therefore \beta = 38^{\circ} 15'.0; \quad \alpha = 94^{\circ} 28'.3; \quad \alpha = 31.363.
40. a = 0.11111, c = 0.12767, \alpha = 23^{\circ} 15'.6.
                                   \therefore \gamma = 26^{\circ} 59'.1; \beta = 129^{\circ} 45'.3; b = 0.21630;
                                       \gamma' = 153^{\circ} \ 0'.9; \beta' = 3^{\circ} 43'.5; b' = 0.018279.
41. b = 1.4326, c = 1.3671, \gamma = 44^{\circ} 17'.3.
                                   \beta = 47^{\circ} 1'.9; \alpha = 88^{\circ} 40'.8; \alpha = 1.9574;
                                       \beta' = 132^{\circ} 58'.1; \alpha' = 2^{\circ} 44'.6; \alpha' = 0.093706.
42. a = 46.703, b = 57.147, \alpha = 19^{\circ} 17'.7.
                                   \beta = 23^{\circ} 50'.9; \gamma = 136^{\circ} 51'.4; c = 96.652;
                                       \beta' = 156^{\circ} \ 9'.1; \gamma' = 4^{\circ} 33'.2; c' = 11.221.

or $\log \tan x = 0.07590$; c = 337.55.

PART TWO.

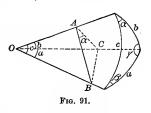

SPHERICAL TRIGONOMETRY.

CHAPTER VIII.

DEFINITIONS AND CONSTRUCTIONS.

112. Spherical Trigonometry treats of the relations between the face angles and the edge angles of a trihedral angle.

An edge angle is the angle between two of the three planes forming the trihedral angle; it is measured by the angle between the lines cut from the two planes by a plane perpendicular to the edge in which the two planes intersect.

A face angle is the angle between two of the edges.

113. Representation of Trihedral Angles. — The relations between the elements of a trihedral angle are discussed by means of the spherical triangle formed by the intersections of the faces with a sphere described with any radius about the vertex as a center. The faces will cut arcs of great circles from the surface of the sphere, their angular measures being the same as those of the face angles; and the angles of the spherical triangle will correspond to the edge angles, each being measured by the angle between two lines lying in the planes of the faces and perpendicular to the line of intersection of the faces.

Hence, in the spherical triangle the sides correspond to the face angles, and the angles to the edge angles of the trihedral angle.

The lengths of the sides in linear measure will depend upon the radius of the sphere, and are computed, when the radius is known, by the proportion

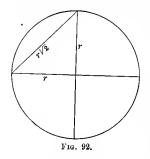

$$360^{\circ}: \alpha = 2 \pi r: l, \tag{1}$$

where α is the number of degrees in the arc, and l is its length.

- 114. Limitation of Values. We shall consider only those triangles in which each element is less than 180°. In the general spherical triangle the sides and angles may have values greater than 180°, but in such a case it is always possible to substitute for the triangle, in the computations, another in which each element shall be less than 180°.
- 115. Definitions and Relations.—A great circle is cut from the surface of a sphere by a plane passing through its center; its radius is equal to the radius of the sphere.

A small circle is cut from the surface by a plane not passing through the center; its radius is always less than the radius of the sphere.

Two planes passing through the center will intersect in a diameter of the sphere, and the two corresponding great circles

will intersect at the ends of this diameter. Hence any two great circles will intersect at two points 180° apart.

To describe a great circle on a sphere, separate the points of a pair of compasses by a distance equal to the chord of 90°, or $r\sqrt{2}$, and describe an arc about any point. If any other distance is used, a small circle will be described. The point used as the

center is called the *pole* of the great circle; its distance from all points on the great circle is evidently 90°.

Any great circle passing through the pole of another great circle will be perpendicular to that great circle

Any two great circles drawn perpendicular to a third great circle will intersect in its pole.

A great circle perpendicular to two great circles will pass through the poles of both, and its plane will be perpendicular to the diameter joining the points of intersection of the two great circles.

The angle between two arcs of great circles is measured by the arc of a great circle described about the vertex as a pole, and limited by the sides, produced if necessary.

The shortest distance between two points on a sphere is the arc of the great circle passing through the points.

116. Constructions. — To find the pole of a given great circle: from any two points on the circle as poles, describe arcs of great circles, and their intersection will be the point required.

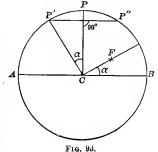

To draw a great circle through two points: find the pole as before, and describe the great circle.

To draw a great circle through a given point perpendicular to a given great circle: from the point as a pole describe an arc of a great circle; its point of intersection with the given circle will be the pole of the required circle. Or, find the pole of the given circle, and then draw the great circle through this pole and the given point.

To cut from a great circle an arc n° long: separate the points of the compasses by a distance equal to the chord of n° , or $2r \sin \frac{1}{2} n^{\circ}$, place the points on the great circle, and the

are intercepted will be the one required.

To construct a great circle passing through a given point and making a given angle with a given great circle: in Fig. 93, let ACB be the given great circle,* P its pole, F the given point, and α the given angle. With P as a pole, draw the small circle P'P'' such that the angular

^{*} The planes of the great circles ACB and CF, and of the small circle $P^\prime P^{\prime\prime}$, are perpendicular to the paper.

distance $PP' = \alpha$; then the pole of the required great circle must be on this small circle. With F as a pole, describe an arc of a great circle cutting the small circle P'P'' in two points; these points will be the poles of two great circles through F, both of which satisfy the given conditions. Only the great circle CF, whose pole is P', is shown in the figure.

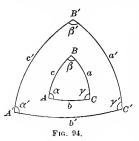

To construct a great circle making a given angle with a given great circle, the point of intersection being given: from the given point as a pole describe a great circle, lay off on it from the given circle a distance equal in angular measure to the given angle, and pass a great circle through the point thus found and the given point of intersection.

117. Definitions. — A right spherical triangle is one which has one angle equal to 90° ; a birectangular triangle has two angles each equal to 90° ; a trirectangular triangle has three angles each equal to 90° .

A quadrantal triangle has one side equal to a quadrant, or 90°; a biquadrantal triangle has two sides each equal to a quadrant; a triquadrantal triangle has three sides each equal to a quadrant.

A birectangular triangle is also biquadrantal, and a trirectangular triangle is also triquadrantal; and vice versa.

118. The Polar Triangle of any triangle is constructed by describing arcs of great circles about the vertices of the origi-

nal triangle as poles. Thus, about A, B, and C as poles, describe the arcs B'C', A'C', and A'B', respectively; that triangle is called the polar in which the vertices A and A', B and B', C and C' are on the same side of BC, AC, and AB, respectively.

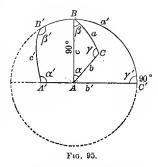

The vertices of the polar triangle will be the poles of the sides of the

original triangle, so that either triangle will be the polar of the other.

The sides of a triangle are the supplements of the opposite angles of the polar, and the angles are the supplements of the opposite sides of the polar; $a' = 180^{\circ} - \alpha$, $a' = 180^{\circ} - a$. Thus, if the angles of a triangle be 120°,

80°, and 60°, the opposite sides of the polar will be 60°, 100°, and 120°.

The polar of a quadrantal triangle is a right triangle, the angle in the polar opposite the quadrant being equal to the supplement of 90°; the polar of a biquadrantal triangle is birectangular; the polar of a triquadrantal triangle is trirectangular; and vice versa.

The triquadrantal triangle is its own polar, each vertex being the pole of the opposite side.

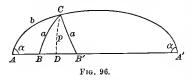

119. In Any Spherical Triangle:

- (1) Each side must be an arc of a great circle.
- (2) Each side must be less than the sum of the other two.
- (3) The greater side is opposite the greater angle, and conversely. Equal sides are opposite equal angles.
 - (4) The sum of the sides must be less than 360°.
- (5) The sum of the angles must be greater than 180° and less than 540° .
- 120. Construction of Triangles. (1) Given the three sides, a, b, c. Draw an arc of a great circle and lay off on it an arc equal to one of the sides, as a. From the extremities of this arc as poles, with radii equal to the chords of b and c respectively, describe arcs of small circles with the compasses, and find their point of intersection. Join this point and the extremities of a by arcs of great circles, and the triangle will be constructed.
- (2) Given the three angles, α , β , γ . Find the sides of the polar triangle, construct it, and then construct the given triangle by using the vertices of the polar as poles.
- (3) Given two sides and the included angle, a, b, γ . Draw an arc of a great circle, and lay off on it an arc equal to one of the sides, as a. Pass an arc of a great circle through one extremity of a, making the angle γ with a, and lay off on it an arc equal to b. Join the extremities of a and b by an arc of a great circle, and the triangle will be constructed.

(4) Given two angles and their included side, α , β , c. — In the polar we know two sides and the included angle, and hence we can construct it by the method just given. Having the polar, we can then construct the required triangle.

Or, draw a great circle and lay off on it an arc equal to c; at the extremities of this arc, construct arcs of great circles making the angles α and β with c; their point of intersection will be the third vertex.

(5) Given two sides and the angle opposite one of them, a, b, α . — Draw any great circle ADA', and through any point

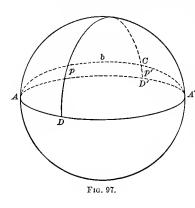

on it, as A, draw a great circle making the angle $DAC = \alpha$ with it. On this circle lay off from A the distance AC = b. With C as a pole, describe a small circle whose radius is equal to

the chord of a, using the compasses; pass arcs of great circles through C, and the points B and B' where this small circle intersects the first great circle ADA', and the triangle will be constructed.

There will be, in general, two points of intersection, and there may therefore be two triangles that will satisfy the conditions of the problem. Only those triangles can be taken in which each side is less than 180° , *i.e.* both B and B' must lie on the arc ADA' between A and A', these points being 180° apart.

If α is acute, as in Fig. 96, α must be greater than p and

less than the shorter of the two distances CA and CA' (b and $180^{\circ} - b$) in order that there may be two solutions.

If α is obtuse, as in Fig. 97, CD' is the least and CD the greatest distance of C from ADA'D', DCD' being perpendicular to ADA'D'. Therefore a must be less than p, in order that the small circle may cut ADA'D'; a must also be greater

than the longer of the two distances CA and CA' (b and $180^{\circ} - b$) in order that the two points of intersection may fall on the arc ADA'.

The conditions, therefore, for two solutions are:

$$a \text{ acute}: a > p, a < b, a < 180^{\circ} - b.$$

 $a \text{ obtuse}: a < p, a > b, a > 180^{\circ} - b.$

Or, a must be intermediate in value between p and both b and $180^{\circ} - b$.

If a is intermediate in value only between p and either b or $180^{\circ} - b$, there will be one solution.

If a is not intermediate in value between p and either b or $180^{\circ} - b$, no solution will be possible, but if p = a, there will be one solution — a right triangle.

(6) Given two angles and the side opposite one of them, α , β , α . — In the polar triangle we know two sides and the angle opposite one of them, and we can construct it; having the polar we can construct the required triangle.

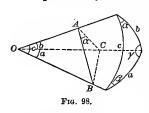

As the polar triangle may admit of two solutions, there may be two solutions of the problem.

CROCK. TRIG. -9

CHAPTER IX.

GENERAL FORMULAS.

121. The Cosine of Any Side of a Spherical Triangle is equal to the product of the cosines of the other two sides, increased by the

product of the sines of these two sides multiplied by the cosine of their included angle. — Let the plane BAC be perpendicular to OA at any point A, and let AC, BC, and BA be its intersections with the faces of the trihedral angle. Then $BAC = \alpha$, and AB and AC are

perpendicular to OA, i.e. OAB and OAC are triangles right-angled at A.

In the triangle BAC we have

$$BC^2 = AB^2 + AC^2 - 2AB \cdot AC\cos\alpha.$$

In the triangle BOC,

 \mathbf{or}

$$BC^2 = OB^2 + OC^2 - 2 OB \cdot OC \cos a$$
.

Equating the values of BC^2 , and transposing,

$$2 \ OB \cdot OC \cos a = OB^2 - AB^2 + OC^2 - AC^2 + 2AB \cdot AC \cos \alpha.$$

In the right triangles OAB and OAC,

$$OB^2 - AB^2 = OA^2$$
, and $OC^2 - AC^2 = OA^2$.

$$\therefore 2 OB \cdot OC \cos \alpha = OA^2 + OA^2 + 2 AB \cdot AC \cos \alpha;$$

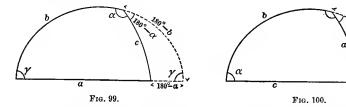

or
$$OB \cdot OC \cos a = OA^2 + AB \cdot AC \cos \alpha$$
.

$$\therefore \cos \alpha = \frac{OA}{OC} \cdot \frac{OA}{OB} + \frac{AC}{OC} \cdot \frac{AB}{OB} \cos \alpha;$$

 $\cos a = \cos b \cos c + \sin b \sin c \cos a. \tag{1}$

In this proof b and c are assumed to be less than 90°, while a and a may have any values less than 180°. The formula is true, however, when either b or c, or both b and c, exceed 90°.

If, in the triangle represented by the full lines (Fig. 99), b is greater than 90°, then in the dotted triangle formed by completing the arcs of great circles, the two sides are $180^{\circ} - b$, and c, both less than 90°, and the other side and its opposite angle are $180^{\circ} - a$, and $180^{\circ} - a$. Hence we can apply (1) to the dotted triangle, giving

$$\cos (180^{\circ} - a) = \cos (180^{\circ} - b) \cos c + \sin (180^{\circ} - b) \sin c \cos (180^{\circ} - a).$$

 $\therefore -\cos a = -\cos b \cos c - \sin b \sin c \cos a.$

$$\cos a = \cos b \cos c + \sin b \sin c \cos a.$$
 Q.E.D.

If both b and c are greater than 90°, as in Fig. 100, then in the dotted triangle the two sides are $180^{\circ}-b$, and $180^{\circ}-c$, and the other side and its opposite angle are a and a.

$$\cos a = \cos (180^{\circ} - b) \cos (180^{\circ} - c) + \sin (180^{\circ} - b) \sin (180^{\circ} - e) \cos a$$

$$= (-\cos b)(-\cos c) + \sin b \sin c \cos a.$$

$$\cos a = \cos b \cos c + \sin b \sin c \cos a.$$
 Q.E.D.

Therefore the formula is always true when each of the elements of the triangle is less than 180° .

No assumption, then, has been made concerning any element that is not true for all the others. We may therefore change any angle to another, as α to β , if at the same time we change the sides opposite, as α to b, making also the reverse changes, b to α and β to α , in the formula; for this is equivalent to changing the *names* arbitrarily assigned to the sides and angles. Thus, to permute (1) to find $\cos c$, we change α to c, α to c, c to c, and c to c, if they occur in the formula, while c and c will not be affected.

$$\therefore \cos c = \cos b \cos a + \sin b \sin a \cos \gamma.$$

If we assume that our triangle is right-angled, γ being equal to 90°, we can permute between a and b, and α and β , since no assumption is made concerning a and α that is not equally true concerning b and β . But we cannot permute

between α and γ , because γ is assumed to be equal to 90°, while no such assumption is made concerning α .

Permuting (1) in the oblique-angled triangle, we have

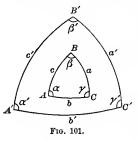

$$\cos a = \cos b \cos c + \sin b \sin c \cos a,$$

$$\cos b = \cos a \cos c + \sin a \sin c \cos \beta,$$

$$\cos c = \cos a \cos b + \sin a \sin b \cos \gamma.$$
(2)

Eq. (1) is called the fundamental equation of spherical trigonometry, since all the other formulas may be derived from it.

122. The Cosine of Any Angle of a Spherical Triangle is equal to the product of the sines of the other two angles multiplied by the

cosine of their included side, diminished by the product of the cosines of the other two angles.—We have

$$\cos a = \cos b \cos c + \sin b \sin c \cos \alpha. \quad (1)$$

Since the angles of the polar triangle are the supplements of the sides opposite in the original triangle, and vice versa, we have

$$a = 180^{\circ} - \alpha', \ b = 180^{\circ} - \beta', \ c = 180^{\circ} - \gamma', \ \alpha = 180^{\circ} - \alpha'.$$

Substituting in (1),

$$\cos (180^{\circ} - \alpha') = \cos (180^{\circ} - \beta') \cos (180^{\circ} - \gamma')$$

$$+ \sin (180^{\circ} - \beta') \sin (180^{\circ} - \gamma') \cos (180^{\circ} - \alpha'),$$
or
$$- \cos \alpha' = (-\cos \beta') (-\cos \gamma') + \sin \beta' \sin \gamma' (-\cos \alpha').$$

$$\therefore \cos \alpha' = -\cos \beta' \cos \gamma' + \sin \beta' \sin \gamma' \cos \alpha'.$$

This formula expresses a relation between the elements of the polar triangle; but, since the polar may be any spherical triangle, it expresses the value of the cosine of an angle of any spherical triangle. Dropping the primes and permuting,

$$\cos \alpha = -\cos \beta \cos \gamma + \sin \beta \sin \gamma \cos \alpha,$$

$$\cos \beta = -\cos \alpha \cos \gamma + \sin \alpha \sin \gamma \cos b,$$

$$\cos \gamma = -\cos \alpha \cos \beta + \sin \alpha \sin \beta \cos c.$$
(2)

123. The Sine Proportion. — The sines of the sides of a spherical triangle are to each other as the sines of the opposite angles.

 $\sin b \sin c \cos \alpha = \cos a - \cos b \cos c$.

$$\therefore \sin^2 b \sin^2 c \cos^2 a = \cos^2 a + \cos^2 b \cos^2 c - 2 \cos a \cos b \cos c.$$

$$\therefore \sin^2 b \sin^2 c (1 - \sin^2 a) = \cos^2 a + \cos^2 b \cos^2 c - 2 \cos a \cos b \cos c.$$

$$\therefore \sin^2 b \sin^2 c \sin^2 \alpha = \sin^2 b \sin^2 c - \cos^2 \alpha - \cos^2 b \cos^2 c$$

 $+2\cos a\cos b\cos c$

$$= (1 - \cos^2 b)(1 - \cos^2 c) - \cos^2 a - \cos^2 b \cos^2 c + 2 \cos a \cos b \cos c$$

= $1 - \cos^2 b - \cos^2 c - \cos^2 a + 2 \cos a \cos b \cos c$.

Dividing both sides by $\sin^2 a \sin^2 b \sin^2 c$,

$$\frac{\sin^2\alpha}{\sin^2a} = \frac{1 - \cos^2\alpha - \cos^2b - \cos^2c + 2\cos\alpha\cos b\cos c}{\sin^2\alpha\sin^2b\sin^2c}.$$

Permuting,

$$\frac{\sin^2\beta}{\sin^2b} = \frac{1-\cos^2b-\cos^2a-\cos^2c+2\cos b\cos a\cos c}{\sin^2b\sin^2a\sin^2c},$$

$$\frac{\sin^2 \gamma}{\sin^2 c} = \frac{1 - \cos^2 c - \cos^2 b - \cos^2 a + 2\cos c\cos b\cos a}{\sin^2 c\sin^2 b\sin^2 a}$$

The second members of the three equations are identical.

$$\therefore \frac{\sin^2 \alpha}{\sin^2 a} = \frac{\sin^2 \beta}{\sin^2 b} = \frac{\sin^2 \gamma}{\sin^2 c},$$

$$\frac{\sin \alpha}{\sin a} = \frac{\sin \beta}{\sin b} = \frac{\sin \gamma}{\sin c}.$$
(1)

or

Second Proof.—From any point A on OA pass the planes ADC

and ADB perpendicular to OC and OB, respectively, and let AD be their line of intersection. Then AD will be perpendicular to the plane BOC, being the intersection of two planes perpendicular to BOC, and DB and DC will be perpendicular to OB and OC, respectively. The triangles ADC and ADB will be right-angled at D, and

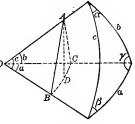

Fig. 102

^{*} Or find $\cos a$ from (1), Art. 121; then $\sin^2 a = 1 - \cos^2 a$, etc.

the triangles ACO and ABO will be right-angled at C and B. Also $ABD = \beta$ and $ACD = \gamma$. Then

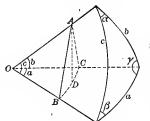

Fig. 103.

 $AD = AB \sin ABD = AB \sin \beta$

and $AD = AC \sin ACD = AC \sin \gamma$.

 $AB \sin \beta = AC \sin \gamma$

But and $AB = OA \sin c$

 $AC = OA \sin b$.

 $\therefore OA \sin c \sin \beta = OA \sin b \sin \gamma.$

 $\therefore \frac{\sin \beta}{\sin b} = \frac{\sin \gamma}{\sin c}$

Permuting,

$$\frac{\sin \alpha}{\sin \alpha} = \frac{\sin \beta}{\sin b} = \frac{\sin \gamma}{\sin c}.$$
 (1)

124. Additional Formulas. — We have

 $\cos b = \cos a \cos c + \sin a \sin c \cos \beta.$

 $\therefore \sin a \sin c \cos \beta = \cos b - (\cos b \cos c + \sin b \sin c \cos \alpha) \cos c$ $=\cos b - \cos b \cos^2 c - \sin b \sin c \cos c \cos a$ $=\cos b \sin^2 c - \sin b \sin c \cos c \cos \alpha$.

$$\therefore \sin a \cos \beta = \cos b \sin c - \sin b \cos c \cos a. \tag{1}$$

Applying (1) to the polar triangle and dropping the primes, (2) $\sin \alpha \cos b = \cos \beta \sin \gamma + \sin \beta \cos \gamma \cos \alpha$.

Dividing (1), member for member, by the equation

 $\sin a \sin \beta = \sin b \sin \alpha,$

we have

$$\cot \beta = \frac{\cot b \sin c - \cos c \cos \alpha}{\sin \alpha};$$

$$\therefore \sin a \cot \beta = \cot b \sin c - \cos c \cos a. \tag{3}$$

Transposing,

 $\sin c \cot b = \sin \alpha \cot \beta + \cos c \cos \alpha$.

Permuting,

$$\sin a \cot b = \cot \beta \sin \gamma + \cos a \cos \gamma. \tag{4}$$

Other formulas may be found by permuting (1), (2), and (3). Among these are the following:

from (1),
$$\sin a \cos \gamma = \cos c \sin b - \sin c \cos b \cos \alpha$$
; (5)

from (3),
$$\sin \alpha \cot \gamma = \cot c \sin b - \cos b \cos \alpha$$
, (6)

and $\sin \gamma \cot \alpha = \cot a \sin b - \cos b \cos \gamma$. (7)

CHAPTER X.

RIGHT SPHERICAL TRIANGLES.

125. Formulas for Right Spherical Triangles. — The following equations have been shown in Chap. IX to be true for all spherical triangles:

$$\cos c = \cos a \cos b + \sin a \sin b \cos \gamma, \tag{a}$$

$$\cos \alpha = -\cos \beta \cos \gamma + \sin \beta \sin \gamma \cos \alpha, \qquad (b)$$

$$\cos \gamma = -\cos \alpha \cos \beta + \sin \alpha \sin \beta \cos c, \qquad (c)$$

$$\frac{\sin a}{\sin a} = \frac{\sin b}{\sin \beta} = \frac{\sin c}{\sin \gamma},\tag{d}$$

$$\sin a \cos \gamma = \cos c \sin b - \sin c \cos b \cos \alpha, \qquad (e)$$

$$\sin \gamma \cot \alpha = \cot \alpha \sin b - \cos b \cos \gamma. \tag{f}$$

By making $\gamma = 90^{\circ}$ we get seven formulas applicable to right triangles, and by permuting these three others are found.

From
$$(a)$$
, $\cos c = \cos a \cos b$. (1)

From
$$(c)$$
, $\cos c = \cot \alpha \cot \beta$. (2)

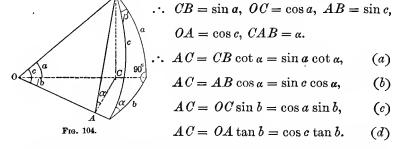

From
$$(b)$$
, $\cos \alpha = \sin \beta \cos \alpha$.
Permuting, $\cos \beta = \sin \alpha \cos b$. (3)

From (e),
$$\cos \alpha = \tan b \cot c$$
.
Permuting, $\cos \beta = \tan a \cot c$. (4)

From
$$(d)$$
, $\sin a = \sin c \sin a$.
From (d) , $\sin b = \sin c \sin \beta$. (5)

From
$$(f)$$
, $\sin b = \tan a \cot a$.
Permuting, $\sin a = \tan b \cot \beta$. (6)

126. Formulas for Right Spherical Triangles. Geometrical Proof. — Let OB be unity. From B pass the plane BAC perpendicular to OA. Then AB and AC are perpendicular to OA, and CB is perpendicular to OC.

Equating these values of AC, we obtain the following formulas:

From (a) and (b),
$$\sin a = \sin c \sin \alpha$$
.
Permuting, $\sin b = \sin c \sin \beta$. (5)

From (a) and (c),
$$\sin b = \tan a \cot a$$
.
Permuting, $\sin a = \tan b \cot \beta$. (6)

From (a) and (d),
$$\cos c = \frac{\sin a}{\tan b} \cot \alpha$$
;

$$\therefore \text{ from } (6), \qquad \cos c = \cot \alpha \cot \beta. \tag{2}$$

From (b) and (c),
$$\cos \alpha = \cos a \frac{\sin b}{\sin c}$$
;

... from the sine proportion or from (5)

Permuting,
$$\cos \alpha = \cos \alpha \sin \beta.$$

$$\cos \beta = \cos b \sin \alpha.$$
 (3)

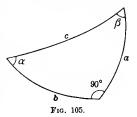

From (b) and (d),
$$\cos \alpha = \tan b \cot c$$
.
Permuting, $\cos \beta = \tan a \cot c$. (4)

From (c) and (d),
$$\cos c = \cos a \cos b$$
. (1)

127. Napier's Rules. — Napier, the celebrated Scotch mathematician, devised two rules by which the ten formulas connecting the elements of a right spherical triangle may be easily written.

He called the sides a and b about the right angle, and the

complements of the two oblique angles and of the hypotenuse, the parts of the triangle, not considering the right angle as a part; the parts, then, are a, b, $90^{\circ} - c$, $90^{\circ} - \alpha$, $90^{\circ} - \beta$, which we shall call $a, b, c', \alpha', \beta'$. By reference to the circular figure, in which the parts are arranged in their order in going around the triangle, it will be seen that if any three parts are considered, either one will lie between the two others, being adjacent to both, or one will be separated from the other two by intermediate parts. Thus b lies between α' and α , being adjacent to both, and β' is separated from both a' and b. The part which lies between two others adjacent to it or is separated from both the others

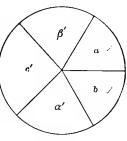

Fig. 106.

by intervening parts, is called the *middle part*; the two others, if adjacent to it, are called *adjacent parts*, and if separated, opposite parts. Thus, if c', α' , and b are considered, α' is the middle part, and c' and b are the adjacent parts; if c', β' , and b are considered, b is the middle part, and c' and b' are the opposite parts.

Napier's rules are:

- 1. The sine of the middle part is equal to the product of the tangents of the adjacent parts.
- 2. The sine of the middle part is equal to the product of the cosines of the opposite parts.

The rules may be easily remembered by the a in the words tangent and adjacent and the o in cosine and opposite.

If, in a right triangle, any two elements besides the right angle are given, the other elements may always be expressed in terms of these two by Napier's rules. Thus, let the given elements be α and c.

(1) To find α ; of the three parts α , c', and α' , α is the middle part, and c' and α' are the opposite parts.

$$\therefore \sin a = \cos c' \cos \alpha' = \cos (90^{\circ} - c) \cos (90^{\circ} - \alpha) = \sin c \sin \alpha.$$

$$\therefore \sin \alpha = \frac{\sin \alpha}{\sin c}$$

(2) To find β ; of the three parts a, c', and β' , β' is the middle part, and a and c' are the adjacent parts.

$$\therefore \sin \beta' = \tan a \tan c'.$$

$$\therefore \sin (90^{\circ} - \beta) = \tan a \tan (90^{\circ} - c).$$

$$\therefore \cos \beta = \tan a \cot c.$$

(3) To find b; of the three parts a, c', and b, c' is the middle part, and a and b are the opposite parts.

$$\therefore \sin c' = \cos a \cos b.$$

$$\therefore \sin (90^{\circ} - c) = \cos a \cos b.$$

$$\therefore \cos c = \cos a \cos b.$$

$$\therefore \cos b = \frac{\cos c}{\cos a}.$$

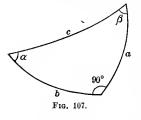

128. Species.—Two angular quantities are said to be of the same species when both are less or both greater than 90°, i.e. when they are in the same quadrant; and of different species when they are in different quadrants.

129. Rules for Species in Right Spherical Triangles.

(1) An oblique angle and its opposite side are always of the same species. From Napier's rules,

$$\sin b = \tan a \cot \alpha$$
.

But $\sin b$ is always positive, and therefore $\tan a$ and $\cot \alpha$ must have the same sign; if they are both positive a and α will be in

the first quadrant, and if both are negative a and α will be in the second quadrant.

(2) If the hypotenuse is less than 90°, the two oblique angles (and therefore the two sides) are of the same species; if it is greater than 90°, the two angles (and therefore the two sides) are of dif-

ferent species. From Napier's rules,

$$\cos c = \cot \alpha \cot \beta = \cos \alpha \cos b$$
.

If c is less than 90° its cosine will be positive; $\cot \alpha$ and $\cot \beta$ must therefore have the same sign, and hence α and β must be in the same quadrant. If c is greater than 90° its cosine will be negative; $\cot \alpha$ and $\cot \beta$ must therefore have different signs, and hence α and β must be in different quadrants.

Thus, if $a=40^{\circ}$ and $\beta=60^{\circ}$, α and b must be, from the first rule, in the first quadrant; and, since α and β (or α and b) are in the same quadrant, c must be, from the second rule, in the first quadrant. If $\alpha=70^{\circ}$ and $c=110^{\circ}$, from the second rule we see that β must be in the second quadrant, and from the first rule that α is in the first and b in the second quadrant.

- 130. Solution of Right Spherical Triangles. There are six possible cases, all of which may be solved by Napier's rules:
 - I. Given the hypotenuse and an angle.
 - II. Given the hypotenuse and a side.
 - III. Given the two angles.
 - IV. Given the two sides.
 - V. Given an angle and the adjacent side.
 - VI. Given an angle and the opposite side.

The required elements should always be determined directly from the given elements.

First write the three formulas, each containing the two given elements and one required element; arrange the three formulas for logarithmic computation; and then write the values of the functions in their proper places, being very careful about writing n after the logarithms of the negative functions. If the number of negative factors is even, the result will be positive; if it is odd, the result will be negative and n should be written after the resulting logarithm.

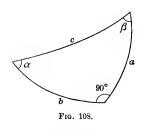

If the sine of a quantity is found by the computation to be positive, the quantity may be either in the first or in the second quadrant, the proper quadrant being determined by the rules for species; if the sine is negative the triangle is impossible, since the elements of the triangle are each less than 180°. If the cosine, tangent, or cotangent is found to be positive, the quantity lies in the first quadrant; if negative, the quantity lies in the second quadrant.

A check formula in each case is found by applying Napier's rules to the three unknown elements; thus, if a and b are given, a, β , and c will be computed, and the check formula is

$$\cos c = \cot \alpha \cot \beta$$
.

131. Case I. Given the Hypotenuse and an Angle.

1.
$$c = 129^{\circ} 14'.6$$
, $\alpha = 43^{\circ} 15'.7$.

To find β ; $\cos c = \cot \alpha \cot \beta$;

$$\therefore \cot \beta = \frac{\cos c}{\cot \alpha}$$

To find b; $\cos \alpha = \tan b \cot c$;

$$\therefore \tan b = \frac{\cos \alpha}{\cot c}$$

To find a; $\sin a = \sin a \sin c$.

Check: $\sin a = \tan b \cot \beta$.

By the rules for species β must be in the second, a in the first, and b in the second quadrant.

2.
$$c = 110^{\circ}$$
, $\beta = 48^{\circ} 28'.6$.

$$a = 118^{\circ} 46'.1$$
; $b = 44^{\circ} 42'.7$; $a = 111^{\circ} 7'.2$.

132. Case II. Given the Hypotenuse and a Side.

1.
$$c = 75^{\circ} 0'.4$$
, $a = 32^{\circ} 56'.$ $\therefore b = 72^{\circ} 2'.8$; $a = 34^{\circ} 15'.0$; $\beta = 80^{\circ} 0'.6$.

2.
$$c = 100^{\circ} 12'$$
, $b = 40^{\circ} 30'.3$. $\alpha = 103^{\circ} 28'.1$; $\alpha = 98^{\circ} 50'.5$; $\beta = 41^{\circ} 17'.7$.

133. Case III. Given the Two Angles.

1.
$$\alpha = 30^{\circ} 51'.2$$
, $\beta = 71^{\circ} 36'$. $\alpha = 25^{\circ} 12'.8$; $b = 52^{\circ} 0'.75$; $c = 56^{\circ} 9'.6$.

2.
$$\alpha = 130^{\circ} 20'$$
, $\beta = 100^{\circ} 10'.9$. $\alpha = 131^{\circ} 7'.0$; $b = 103^{\circ} 24'.5$; $c = 81^{\circ} 13'.7$.

134. Case IV. Given the Two Sides.

1.
$$a = 43^{\circ}20'$$
, $b = 74^{\circ}13'$. $c = 78^{\circ}35'.3$; $a = 44^{\circ}26'.0$; $\beta = 79^{\circ}1'.4$.

2.
$$a = 100^{\circ}$$
, $b = 98^{\circ} 20$. $c = 88^{\circ} 33'.5$; $a = 99^{\circ} 53'.8$; $\beta = 98^{\circ} 12'.5$.

135. Case V. Given One Side and the Adjacent Angle.

1.
$$b = 66^{\circ}29'$$
, $\alpha = 50^{\circ}17'$. . . $a = 47^{\circ}49'.5$; $c = 74^{\circ}27'.6$; $\beta = 72^{\circ}7'.5$.

2.
$$a = 24^{\circ} 41'$$
, $\beta = 140^{\circ} 34'.7$ $b = 161^{\circ} 3'.2$; $c = 149^{\circ} 15'.0$; $\alpha = 54^{\circ} 45'.6$.

136. Case VI. Given One Side and the Angle Opposite. — Let α and α be the given elements.

To find b; $\sin b = \tan a \cot \alpha$.

To find c; $\sin a = \sin c \sin a$; $\therefore \sin c = \frac{\sin a}{\sin a}$

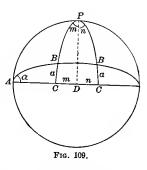

To find β ; $\cos \alpha = \cos a \sin \beta$; $\therefore \sin \beta = \frac{\cos \alpha}{\cos a}$

All three quantities are found by their sines; each of the three quantities may therefore be in either the first or the second quadrant, and there will be two solutions.*

If P is the pole of AC, PC will be perpendicular to AC, and the distances BC will be equal if m is equal to n. Either of the triangles ABC will satisfy the conditions of the problem, being right-angled at C and

having $A = \alpha$ and BC = a.

The rules for species must be applied in determining which values belong to each solution. Thus, if α is greater than 90°, and β in the first solution is less than 90°, c must be greater than 90° in that triangle; in the second

triangle, where β is greater than 90°, c must be less than 90°. Each side, of course, is of the same species as its opposite angle. These results may be written:

First solution: $\alpha > 90^{\circ}$; $\beta < 90^{\circ}$; $c > 90^{\circ}$; $a > 90^{\circ}$; $b < 90^{\circ}$. Second solution: $\alpha > 90^{\circ}$; $\beta > 90^{\circ}$; $c < 90^{\circ}$; $a > 90^{\circ}$; $b > 90^{\circ}$.

1. $a = 160^{\circ} 12'.2$, $a = 150^{\circ} 37'$.

2.
$$b = 40^{\circ} \, 50^{!}$$
, $\beta = 62^{\circ} \, 14^{!}$. $\therefore a = 27^{\circ} \, 3^{!}.9$; $a = 38^{\circ} \, 0^{!}.4$; $c = 47^{\circ} \, 38^{!}.6$; or $a' = 152^{\circ} \, 56^{!}.1$; $a' = 141^{\circ} \, 59^{!}.6$; $c' = 132^{\circ} \, 21^{!}.4$.

^{*} The triangle is supposed to be possible. The two solutions are identical when a=a.

137. Special Cases.

- 1. $c = 90^{\circ}$, $\alpha = 90^{\circ}$. . . $\alpha = 90^{\circ}$; b and β indeterminate.
- 2. $c = 90^{\circ}$, $a = 90^{\circ}$. . . $a = 90^{\circ}$; b and β indeterminate.
- 3. $\alpha = 90^{\circ}$, $\beta = 90^{\circ}$. $\alpha = 90^{\circ}$; $b = 90^{\circ}$; $c = 90^{\circ}$.
- **4.** $a = 90^{\circ}$, $b = 90^{\circ}$. $c = 90^{\circ}$; $a = 90^{\circ}$; $\beta = 90^{\circ}$.
- **5.** $a = 90^{\circ}$, $\beta = 90^{\circ}$. $c = 90^{\circ}$; $b = 90^{\circ}$; $\alpha = 90^{\circ}$.
- 6. $a = 20^{\circ}$, $\alpha = 20^{\circ}$. $c = 90^{\circ}$; $b = 90^{\circ}$; $\beta = 90^{\circ}$.

138. Additional Examples.

- 1. $a = 40^{\circ} 42'.4$, $c = 63^{\circ} 20'$.
 - $b = 53^{\circ} 41'.9$; $\alpha = 46^{\circ} 52'.25$; $\beta = 64^{\circ} 24'.0$.
- 2. $a = 70^{\circ} 15'.5$, $\alpha = 81^{\circ} 42'.7$.

...
$$b=23^{\circ}\,57'.0$$
; $\beta=25^{\circ}\,15'.7$; $c=72^{\circ}\,1'.25$; or $b'=156^{\circ}\,3'.0$; $\beta'=154^{\circ}\,44'.3$; $c'=107^{\circ}\,58'.75$.

3. $b = 30^{\circ} 32'.4$, $\alpha = 36^{\circ} 44'$.

$$a = 20^{\circ} 46'.0$$
; $c = 36^{\circ} 21'.6$; $\beta = 58^{\circ} 59'.7$.

4. $c = 72^{\circ} 10'$, $\alpha = 30^{\circ} 43'$.

$$\therefore a = 29^{\circ} 5'.6$$
; $b = 69^{\circ} 29'.0$; $\beta = 79^{\circ} 41'.25$.

5. $\dot{a} = 106^{\circ} 34'.2$, $\beta = 33^{\circ} 11'.7$.

$$a = 121^{\circ} 23'.6$$
; $b = 29^{\circ} 11'.0$; $c = 117^{\circ} 3'.0$.

6. $a = 28^{\circ} 47'$, $b = 110^{\circ} 27'.3$.

$$c = 107^{\circ} 50'.2$$
; $\alpha = 30^{\circ} 23'.1$; $\beta = 100^{\circ} 10'.9$.

7. $c = 54^{\circ} 12'.2$, $\beta = 164^{\circ} 50'.4$.

$$\alpha = 99^{\circ} 0'.3$$
; $b = 167^{\circ} 45'.2$; $a = 126^{\circ} 45'.9$.

8. $a = 40^{\circ} 8'$, $\beta = 74^{\circ} 30'.2$.

$$b = 60^{\circ} 43'.5$$
; $c = 72^{\circ} 25'.0$; $a = 42^{\circ} 32'.7$.

9. $c = 102^{\circ} 36'$, $\alpha = 125^{\circ} 13'.4$.

$$a = 127^{\circ} 8'.1$$
; $b = 68^{\circ} 49'.0$; $\beta = 72^{\circ} 49'.8$.

10. $\alpha = 40^{\circ} 42'.4$, $\beta = 67^{\circ} 51'.6$,

$$a = 35^{\circ} 4'.4$$
; $b = 54^{\circ} 42'.0$; $c = 61^{\circ} 46'.6$.

11. $b = 163^{\circ} 14'.2$, $c = 112^{\circ} 41'.8$.

$$\alpha = 66^{\circ} 14'.1$$
; $\alpha = 82^{\circ} 45'.75$; $\beta = 161^{\circ} 46'.9$.

12. $a = 120^{\circ} 30'.2$, $b = 140^{\circ} 12'$.

$$c = 67^{\circ} 2'.8$$
; $\alpha = 110^{\circ} 39'.7$; $\beta = 135^{\circ} 57'.7$.

13. $c = 50^{\circ} 20'.2$, $\beta = 101^{\circ} 29'.4$.

$$\alpha = 166^{\circ} 29'.5$$
; $b = 131^{\circ} 1'.7$; $\alpha = 162^{\circ} 20'.1$.

14. $\alpha = 82^{\circ} 4'.4$, $\beta = 8^{\circ} 22'.3$.

$$a = 18^{\circ} 42'.2$$
; $c = 18^{\circ} 53'.25$; $b = 2^{\circ} 43'$ or $2^{\circ} 44'$.

15. $a = 130^{\circ} 40'.7$, $c = 75^{\circ} 31'.5$.

$$...$$
 $b = 112^{\circ} 33'.0$; $\alpha = 128^{\circ} 26'.6$; $\beta = 107^{\circ} 28'.75$.

16. $b = 10^{\circ} 10'.2$, $\beta = 15^{\circ} 40'.6$.

$$\therefore$$
 $a = 39^{\circ} 43'.9$; $c = 40^{\circ} 48'.1$; $\alpha = 78^{\circ} 0'.7$; or $\alpha' = 140^{\circ} 16'.1$; $\alpha' = 139^{\circ} 11'.9$; $\alpha' = 101^{\circ} 59'.3$.

17. $b = 57^{\circ} 8'.3$, $a = 104^{\circ} 16'.2$.

$$\alpha = 106^{\circ} 50'.8$$
; $c = 99^{\circ} 2'.8$; $\beta = 58^{\circ} 16'.4$.

18. $a = 20^{\circ} 54'$, $b = 64^{\circ} 26'.7$.

$$c = 66^{\circ} 14'.1$$
; $\alpha = 22^{\circ} 56'.5$; $\beta = 80^{\circ} 19'.2$.

Fig. 110.

139. Isosceles Triangles. — If an arc of a great circle be drawn from the vertex perpendicular to the base, it will bisect both the base and the angle at the vertex, dividing the triangle into two equal

right triangles that may be solved by Napier's rules.

1.
$$a = 110^{\circ} 47'.3$$
, $\beta = 92^{\circ} 14'.6$.

$$\therefore \frac{1}{2}\beta = 46^{\circ} 7'.3.$$

To find α : $\cos \alpha = \cot \alpha \cot \frac{1}{2} \beta$;

$$\therefore \cot \alpha = \frac{\cos \alpha}{\cot \frac{1}{2}\beta}.$$

To find $\frac{1}{2}b$: $\sin \frac{1}{2}b = \sin \alpha \sin \frac{1}{2}\beta$.

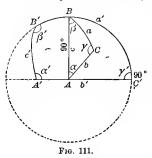

To find
$$p$$
: $\cos \frac{1}{2}\beta = \tan p \cot a$; $\therefore \tan p = \frac{\cos \frac{1}{2}\beta}{\cot a}$

Check: $\sin \frac{1}{2}b = \tan p \cot \alpha$.

2.
$$a = 82^{\circ} 26'$$
, $\beta = 64^{\circ} 42'$. $\therefore a = 77^{\circ} 53'.6$; $\frac{1}{2}b = 31^{\circ} 32'.75$.

3.
$$b = 56^{\circ} 41'$$
, $\beta = 112^{\circ} 44'.6$.
 $\therefore a = 38^{\circ} 59'.6$; $a = 34^{\circ} 45'.6$; or $a' = 141^{\circ} 0'.4$; $a' = 145^{\circ} 14'.4$.

140. Quadrantal Triangles. - The polar of a quadrantal tri-

angle is a right triangle whose angles are the supplements of the sides, and whose sides are the supplements of the angles, of the original triangle. We may therefore solve the polar by Napier's rules, and then find the elements of the original triangle by taking the supplements of the elements of the polar.

- 1. $c = 90^{\circ}$, $\alpha = 23^{\circ} 14'.7$, $b = 27^{\circ} 14'.6$.
- $\gamma' = 90^{\circ}$, $\alpha' = 156^{\circ} 45'.3$, $\beta' = 152^{\circ} 45'.4$

are the elements of the polar triangle.*

To find
$$c'$$
: $\cos \beta' = \tan \alpha' \cot c'$; $\therefore \cot c' = \frac{\cos \beta'}{\tan \alpha'}$

To find
$$b'$$
: $\sin a' = \tan b' \cot \beta'$; $\therefore \tan b' = \frac{\sin a'}{\cot \beta'}$

To find α' : $\cos \alpha' = \cos \alpha' \sin \beta'$.

Check: $\cos \alpha' = \cot c' \tan b'$.

2. $c = 90^{\circ}$, $\gamma = 98^{\circ} 22'.7$, $\alpha = 150^{\circ} 47'$.

$$a = 150^{\circ} 26'.2$$
; $b = 94^{\circ} 43'.5$; $\beta = 99^{\circ} 36'.6$.

3. $c = 90^{\circ}$, $a = 121^{\circ} 30'$, $\beta = 112^{\circ} 16'.2$.

...
$$b = 108^{\circ} 51'.1$$
; $\alpha = 123^{\circ} 30'.75$; $\gamma = 102^{\circ} 4'.7$.

4. $c = 90^{\circ}$, $a = 138^{\circ} 47'.8$, $b = 107^{\circ} 54'.9$.

$$\alpha = 142^{\circ} 15'.2$$
; $\beta = 117^{\circ} 50'.25$; $\gamma = 111^{\circ} 40'.1$.

5. $c = 90^{\circ}$, $a = 112^{\circ}$ 6'.5, $\gamma = 74^{\circ} 30'$.

..
$$b = 56^{\circ} 39'.6$$
; $\alpha = 116^{\circ} 46'.4$; $\beta = 53^{\circ} 36'.9$.

- 6. $c = 90^{\circ}$, $\alpha = 83^{\circ} 20'.6$, $\beta = 77^{\circ} 14'.3$. $\therefore a = 83^{\circ} 30'.3$; $b = 77^{\circ} 19'.3$; $\gamma = 91^{\circ} 28'.0$.
- 7. $c = 90^{\circ}$, $a = 94^{\circ} 22'.2$, $\alpha = 108^{\circ} 13'.3$. $\therefore b = 14^{\circ} 6'.2$; $\beta = 13^{\circ} 25'.3$; $\gamma = 72^{\circ} 17'.5$; or $b' = 165^{\circ} 53'.8$; $\beta' = 166^{\circ} 34'.7$; $\gamma' = 107^{\circ} 42'.5$.

^{*} Note that α' , β' , and c' are not the parts of the right triangle, but their complements.

141. Quadrantal Triangles may also be solved by the use of Fig. 112, in which B, one of the vertices adjacent to the quadrantal side, is the pole of the great circle MDGN.

If the triangle has one side less than 90°, as BC in the tri-

angle ABC, produce that side to D. In the triangle ACD, $ADC = 90^{\circ}$, $DAC = 90^{\circ} - \alpha$, $ACD = 180^{\circ} - \gamma$, AC = b, $CD = 90^{\circ} - a$, and $AD = \beta$ since AD = ABD. Therefore, if any two elements of ACB besides the quadrant are given, we know two elements of the right triangle ACD in addition to the right angle. Hence we could solve it by Napier's rules, thence obtaining the elements of ABC.

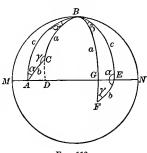

Fig. 112.

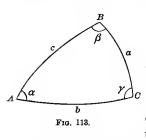

If one side of the triangle is greater than 90°, as in BEF, then in the triangle GEF we have GF = a - 90°, $GE = \beta$, EF = b, FGE = 90°, $GEF = \alpha - 90°$, and $GFE = \gamma$. If any two elements of BFE besides the quadrantal side are given, we then know two elements of the triangle GFE in addition to the right angle. Hence we could solve it by Napier's rules, thence finding the elements of BFE.

CROCK, TRIG. - 10

CHAPTER XI.

OBLIQUE SPHERICAL TRIANGLES.

142. To find an Angle, having given the Three Sides.

(a)
$$\cos a = \cos b \cos c + \sin b \sin c \cos a$$
;

$$\therefore \cos a = \frac{\cos a - \cos b \cos c}{\sin b \sin c}, \tag{1}$$

which may be solved by the use of the natural functions.

(b)* To adapt (1) to logarithmic computation, subtract each member from unity.

$$\therefore 1 - \cos \alpha = 1 - \frac{\cos \alpha - \cos b \cos c}{\sin b \sin c} = \frac{\sin b \sin c - \cos \alpha + \cos b \cos c}{\sin b \sin c}$$

$$\therefore 2\sin^2\frac{1}{2}\alpha = \frac{\cos(b-c) - \cos a}{\sin b \sin c}$$

Applying (4) of Art. 73,

$$\cos u - \cos v = -2 \sin \frac{1}{2} (u+v) \sin \frac{1}{2} (u-v),$$

we have
$$\cos(b-c) - \cos a = -2 \sin \frac{1}{2}(b-c+a) \sin \frac{1}{2}(b-c-a)$$

= $+2 \sin \frac{1}{2}(a+b-c) \sin \frac{1}{2}(a-b+c)$,

since $\sin(-x) = -\sin x$.

Let
$$a+b+c=2s$$
; ... $a+b-c=2s-2c=2(s-c)$; $a-b+c=2s-2b=2(s-b)$.

$$\therefore \cos(b-c) - \cos a = 2\sin(s-c)\sin(s-b).$$

$$\cdot \cdot \sin^2 \frac{1}{2} \alpha = \frac{\sin (s-b) \sin (s-c)}{\sin b \sin c} \cdot$$

Permuting,

$$\sin^{2}\frac{1}{2}\beta = \frac{\sin (s - a)\sin (s - c)}{\sin a \sin c},$$

$$\sin^{2}\frac{1}{2}\gamma = \frac{\sin (s - a)\sin (s - b)}{\sin a \sin b}.$$
(2)

* Compare with Art. 99.

(c)* Add each member of (1) to unity.

$$\therefore 1 + \cos \alpha = 1 + \frac{\cos \alpha - \cos b \cos c}{\sin b \sin c}$$

$$= \frac{\cos \alpha - (\cos b \cos c - \sin b \sin c)}{\sin b \sin c}.$$

$$\therefore 2 \cos^2 \frac{1}{2} \alpha = \frac{\cos \alpha - \cos (b + c)}{\sin b \sin c}.$$

Applying (4) of Art. 73, we have

$$\cos a - \cos (b+c) = -2 \sin \frac{1}{2} (a+b+c) \sin \frac{1}{2} (a-b-c)$$

= $+2 \sin \frac{1}{2} (a+b+c) \sin \frac{1}{2} (b+c-a)$.

a+b+c=2s; $\cdot \cdot \cdot b+c-a=2s-2a=2(s-a)$.

 $\therefore \cos a - \cos(b+c) = 2\sin s \sin(s-a).$

Permuting,
$$\cos^{2}\frac{1}{2}\alpha = \frac{\sin s \sin (s - a)}{\sin b \sin c},$$

$$\cos^{2}\frac{1}{2}\beta = \frac{\sin s \sin (s - b)}{\sin a \sin c},$$

$$\cos^{2}\frac{1}{2}\gamma = \frac{\sin s \sin (s - c)}{\sin a \sin b}.$$
(3)

(d) Dividing $\sin^2 \frac{1}{2} \alpha$ by $\cos^2 \frac{1}{2} \alpha$, we have

$$\tan^{2}\frac{1}{2}\alpha = \frac{\sin(s-b)\sin(s-c)}{\sin s\sin(s-a)},$$
Permuting,
$$\tan^{2}\frac{1}{2}\beta = \frac{\sin(s-a)\sin(s-c)}{\sin s\sin(s-b)},$$

$$\tan^{2}\frac{1}{2}\gamma = \frac{\sin(s-a)\sin(s-b)}{\sin s\sin(s-c)}.$$
(4)

We may write

$$\tan \frac{1}{2} \alpha = \frac{1}{\sin (s-a)} \sqrt{\frac{\sin (s-a) \sin (s-b) \sin (s-c)}{\sin s}}.$$

Let
$$r = \sqrt{\frac{\sin(s-a)\sin(s-b)\sin(s-c)}{\sin s}}$$
 (5)

Permuting,

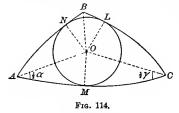

$$\tan \frac{1}{2}\alpha = \frac{r}{\sin(s-a)},$$

$$\tan \frac{1}{2}\beta = \frac{r}{\sin(s-b)},$$

$$\tan \frac{1}{2}\gamma = \frac{r}{\sin(s-c)}.$$
(6)

* Compare with Art. 99.

Note. — The center of the inscribed circle of a spherical triangle is the point of intersection of the arcs of great circles bisecting the angles of the

triangle. From this point O draw the arcs OL, OM, and ON perpendicular to the sides of the triangle.

...
$$MA = AN$$
; $NB = BL$; $CM = LC$.

$$\therefore MA + NB + CM = s.$$

$$\therefore b + NB = s$$
, since $MA + CM = b$.

$$. NB = s - b.$$

In the right triangle OBN, by Napier's rules,

$$\sin NB = \tan ON \cot NBO.$$

$$\therefore \tan ON = \frac{\sin NB}{\cot NBO} = \sin (s - b) \tan \frac{1}{2}\beta$$

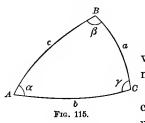

$$= \sin (s - b) \sqrt{\frac{\sin (s - a) \sin (s - c)}{\sin s \sin (s - b)}}$$

$$= \sqrt{\frac{\sin (s - a) \sin (s - b) \sin (s - c)}{\sin s}}$$

$$\therefore \tan ON = r.$$

Hence r is the tangent of the radius of the inscribed circle.

143. To find a Side, having given the Three Angles.

(a)
$$\cos \alpha = -\cos \beta \cos \gamma + \sin \beta \sin \gamma \cos \alpha$$
.

$$\cos a = \frac{\cos \alpha + \cos \beta \cos \gamma}{\sin \beta \sin \gamma}, \qquad (1)$$

which may be solved by the use of the natural functions.

 $(b)^*$ To adapt (1) to logarithmic computation, subtract each member from unity.

$$\therefore 1 - \cos \alpha = 1 - \frac{\cos \alpha + \cos \beta \cos \gamma}{\sin \beta \sin \gamma}$$

$$= -\frac{\cos \beta \cos \gamma - \sin \beta \sin \gamma + \cos \alpha}{\sin \beta \sin \gamma}$$

$$\therefore 2 \sin^2 \frac{1}{2} \alpha = -\frac{\cos (\beta + \gamma) + \cos \alpha}{\sin \beta \sin \gamma}$$

Applying the equation (Art. 73)

$$\cos u + \cos v = 2\cos\frac{1}{2}(u+v)\cos\frac{1}{2}(u-v),$$
 we have
$$\cos(\beta+\gamma) + \cos\alpha = 2\cos\frac{1}{2}(\alpha+\beta+\gamma)\cos\frac{1}{2}(\beta+\gamma-\alpha)$$

* Compare with Art. 99.

Let
$$\alpha + \beta + \gamma = 2S$$
; $\beta + \gamma - \alpha = 2S - 2\alpha = 2(S - \alpha)$.
 $\cos (\beta + \gamma) + \cos \alpha = 2\cos S\cos (S - \alpha)$.

Permuting,

$$\begin{array}{l}
\cdot \cdot \cdot \sin^2 \frac{1}{2} a = \frac{-\cos S \cos (S - a)}{\sin \beta \sin \gamma} \cdot \\
\sin^2 \frac{1}{2} b = \frac{-\cos S \cos (S - \beta)}{\sin \alpha \sin \gamma} \cdot \\
\sin^2 \frac{1}{2} c = \frac{-\cos S \cos (S - \gamma)}{\sin \alpha \sin \beta} \cdot \\
\end{array}$$
(2)

(c)* Add each member of (1) to unity.

$$1 + \cos \alpha = 1 + \frac{\cos \alpha + \cos \beta \cos \gamma}{\sin \beta \sin \gamma}$$
$$= \frac{\cos \alpha + \cos \beta \cos \gamma + \sin \beta \sin \gamma}{\sin \beta \sin \gamma}$$

$$\therefore 2\cos^2\frac{1}{2}a = \frac{\cos\alpha + \cos(\beta - \gamma)}{\sin\beta\sin\gamma}.$$

Applying the equation (Art. 73)

$$\cos u + \cos v = 2\cos\frac{1}{2}(u+v)\cos\frac{1}{2}(u-v),$$

we have $\cos \alpha + \cos (\beta - \gamma) = 2 \cos \frac{1}{2} (\alpha + \beta - \gamma) \cos \frac{1}{2} (\alpha - \beta + \gamma)$.

Let
$$\alpha + \beta + \gamma = 2S$$
; $\alpha + \beta - \gamma = 2S - 2\gamma = 2(S - \gamma)$;

$$\alpha - \beta + \gamma = 2S - 2\beta = 2(S - \beta).$$

$$\therefore \cos \alpha + \cos (\beta - \gamma) = 2\cos (S - \beta)\cos (S - \gamma).$$

Permuting,

$$\cos^{2}\frac{1}{2}\alpha = \frac{\cos(S-\beta)\cos(S-\gamma)}{\sin\beta\sin\gamma},$$

$$\cos^{2}\frac{1}{2}b = \frac{\cos(S-\alpha)\cos(S-\gamma)}{\sin\alpha\sin\gamma},$$

$$\cos^{2}\frac{1}{2}c = \frac{\cos(S-\alpha)\cos(S-\beta)}{\sin\alpha\sin\beta}.$$
(3)

(d) Dividing $\sin^2 \frac{1}{2} a$ by $\cos^2 \frac{1}{2} a$, we have

 $\tan^{2}\frac{1}{2}a = \frac{-\cos S \cos (S - \alpha)}{\cos (S - \beta) \cos (S - \gamma)},$ Permuting, $\tan^{2}\frac{1}{2}b = \frac{-\cos S \cos (S - \beta)}{\cos (S - \alpha) \cos (S - \gamma)},$ $\tan^{2}\frac{1}{2}c = \frac{-\cos S \cos (S - \gamma)}{\cos (S - \alpha) \cos (S - \beta)}.$ (4)

^{*} Compare with Art. 99.

We may write

$$\tan \frac{1}{2} \alpha = \cos (S - \alpha) \sqrt{\frac{-\cos S}{\cos (S - \alpha) \cos (S - \beta) \cos (S - \gamma)}}.$$

Let

$$R = \sqrt{\frac{-\cos S}{\cos (S - \alpha)\cos (S - \beta)\cos (S - \gamma)}}.$$
 (5)

Permuting,

$$\tan \frac{1}{2} a = R \cos (S - \alpha).$$

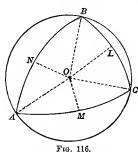

$$\tan \frac{1}{2} b = R \cos (S - \beta),$$

$$\tan \frac{1}{2} c = R \cos (S - \gamma).$$
(6)

Note. —Since the sum of the angles 2~S must be between 180° and 540° , S must be between 90° and 270° , so that $\cos S$ is always negative and hence $-\cos S$ is always positive.

Note. — The center of the circumscribed circle of a spherical triangle is the point of intersection of the arcs of great circles perpendicular to the sides of the triangle at their middle points.

..
$$AN = NB$$
; $BL = LC$; $CM = MA$.
.. $OAM = OCM$; $OAN = OBN$; $OCL = OBL$.
.. $OAM + OAN + OCL = S$,
.. $OCL = S - (OAM + OAN) = S - \alpha$.

In the right triangle OCL, by Napier's rules, $\cos OCL = \tan LC \cot OC$.

$$\therefore \tan OC = \frac{\tan LC}{\cos OCL} = \frac{\tan \frac{1}{2}\alpha}{\cos (S-\alpha)}$$

$$= \frac{1}{\cos (S-\alpha)} \sqrt{\frac{-\cos S\cos (S-\alpha)}{\cos (S-\beta)\cos (S-\gamma)}}$$

$$= \sqrt{\frac{-\cos S}{\cos (S-\alpha)\cos (S-\beta)\cos (S-\gamma)}}.$$

Hence R is the tangent of the radius of the circumscribed circle.

144. Napier's Analogies.

(1) From (4) or (6), Art. 142,

$$\frac{\tan\frac{1}{2}\alpha}{\tan\frac{1}{2}\beta} = \frac{\sin(s-b)}{\sin(s-a)}.$$

By division and composition,

$$\frac{\tan\frac{1}{2}\alpha - \tan\frac{1}{2}\beta}{\tan\frac{1}{2}\alpha + \tan\frac{1}{2}\beta} = \frac{\sin(s-b) - \sin(s-a)}{\sin(s-b) + \sin(s-a)}.$$
 (a)

But

$$\frac{\tan\frac{1}{2}\alpha - \tan\frac{1}{2}\beta}{\tan\frac{1}{2}\alpha + \tan\frac{1}{2}\beta} = \frac{\sin\frac{1}{2}\alpha\cos\frac{1}{2}\beta - \cos\frac{1}{2}\alpha\sin\frac{1}{2}\beta}{\sin\frac{1}{2}\alpha\cos\frac{1}{2}\beta + \cos\frac{1}{2}\alpha\sin\frac{1}{2}\beta} = \frac{\sin\frac{1}{2}(\alpha - \beta)}{\sin\frac{1}{2}(\alpha + \beta)}.$$

Also, from (1) and (2), Art. 73,

$$\frac{\sin(s-b) - \sin(s-a)}{\sin(s-b) + \sin(s-a)} = \frac{2\cos\frac{1}{2}(2s-a-b)\sin\frac{1}{2}(a-b)}{2\sin\frac{1}{2}(2s-a-b)\cos\frac{1}{2}(a-b)}$$
$$= \frac{\tan\frac{1}{2}(a-b)}{\tan\frac{1}{2}c}.$$

Substituting these values in (a), and reversing the order,

$$\frac{\tan\frac{1}{2}(a-b)}{\tan\frac{1}{2}c} = \frac{\sin\frac{1}{2}(\alpha-\beta)}{\sin\frac{1}{2}(\alpha+\beta)}.$$
 (1)

(2) Substituting the values of a, b, c, α , and β in terms of the elements of the polar triangle, (1) becomes

$$\frac{\tan\frac{1}{2}(180^{\circ} - a' - 180^{\circ} + \beta')}{\tan\frac{1}{2}(180^{\circ} - \gamma')} = \frac{\sin\frac{1}{2}(180^{\circ} - a' - 180^{\circ} + b')}{\sin\frac{1}{2}(180^{\circ} - a' + 180^{\circ} - b')}.$$

$$\therefore \frac{\tan\frac{1}{2}(\beta' - a')}{\cot\frac{1}{2}\gamma'} = \frac{\sin\frac{1}{2}(b' - a')}{\sin\frac{1}{2}(a' + b')}.$$

$$\therefore \frac{-\tan\frac{1}{2}(a' - \beta')}{\cot\frac{1}{2}\gamma'} = \frac{-\sin\frac{1}{2}(a' - b')}{\sin\frac{1}{2}(a' + b')}.$$

Changing the signs and dropping the primes,

$$\frac{\tan\frac{1}{2}(\alpha-\beta)}{\cot\frac{1}{2}\gamma} = \frac{\sin\frac{1}{2}(a-b)}{\sin\frac{1}{2}(a+b)}.$$
 (2)

(3) From (4), Art. 142,

$$\tan \frac{1}{2} \alpha \tan \frac{1}{2} \beta = \frac{\sin (s - c)}{\sin s}$$

$$\therefore \frac{1+\tan\frac{1}{2}\alpha\tan\frac{1}{2}\beta}{1-\tan\frac{1}{2}\alpha\tan\frac{1}{2}\beta} = \frac{\sin s + \sin(s-c)}{\sin s - \sin(s-c)}$$
 (b)

But
$$\frac{1 + \tan\frac{1}{2}\alpha \tan\frac{1}{2}\beta}{1 - \tan\frac{1}{2}\alpha \tan\frac{1}{2}\beta} = \frac{\cos\frac{1}{2}\alpha \cos\frac{1}{2}\beta + \sin\frac{1}{2}\alpha \sin\frac{1}{2}\beta}{\cos\frac{1}{2}\alpha \cos\frac{1}{2}\beta - \sin\frac{1}{2}\alpha \sin\frac{1}{2}\beta}$$
$$= \frac{\cos\frac{1}{2}(\alpha - \beta)}{\cos\frac{1}{2}(\alpha + \beta)}.$$

Also, from (1) and (2), Art. 73,

$$\frac{\sin s + \sin (s - c)}{\sin s - \sin (s - c)} = \frac{2\sin \frac{1}{2}(2s - c)\cos \frac{1}{2}c}{2\cos \frac{1}{2}(2s - c)\sin \frac{1}{2}c} = \frac{\tan \frac{1}{2}(a + b)}{\tan \frac{1}{2}c}.$$

Substituting these values in (b), and reversing the order,

$$\frac{\tan\frac{1}{2}(\alpha+b)}{\tan\frac{1}{2}c} = \frac{\cos\frac{1}{2}(\alpha-\beta)}{\cos\frac{1}{2}(\alpha+\beta)}.$$
 (3)

(4) Passing to the polar triangle, (3) becomes

$$\frac{\tan\frac{1}{2}(180^{\circ} - a' + 180^{\circ} - \beta')}{\tan\frac{1}{2}(180^{\circ} - \gamma')} = \frac{\cos\frac{1}{2}(180^{\circ} - a' - 180^{\circ} + b')}{\cos\frac{1}{2}(180^{\circ} - a' + 180^{\circ} - b')}$$

$$\therefore \frac{\tan\left[180^{\circ} - \frac{1}{2}(a' + \beta')\right]}{\tan\left(90^{\circ} - \frac{1}{2}\gamma'\right)} = \frac{\cos\frac{1}{2}(b' - a')}{\cos\left[180^{\circ} - \frac{1}{2}(a' + b')\right]}$$

$$\therefore \frac{-\tan\frac{1}{2}(a' + \beta')}{\cot\frac{1}{2}\gamma'} = \frac{\cos\frac{1}{2}(a' - b')}{-\cos\frac{1}{2}(a' + b')}$$

Changing the signs and dropping the primes,

$$\frac{\tan\frac{1}{2}(\alpha+\beta)}{\cot\frac{1}{2}\gamma} = \frac{\cos\frac{1}{2}(\alpha-b)}{\cos\frac{1}{2}(\alpha+b)}.$$
 (4)

Eqs. (1), (2), (3), and (4) are called Napier's Analogies.

145. Gauss's Equations. — From (2) and (3), Art. 142, we have

$$\sin \frac{1}{2} \alpha \cos \frac{1}{2} \beta = \frac{\sin (s-b)}{\sin c} \sqrt{\frac{\sin s \sin (s-c)}{\sin a \sin b}} = \frac{\sin (s-b)}{\sin c} \cos \frac{1}{2} \gamma;$$

$$\cos \frac{1}{2} \alpha \sin \frac{1}{2} \beta = \frac{\sin (s-a)}{\sin c} \sqrt{\frac{\sin s \sin (s-c)}{\sin a \sin b}} = \frac{\sin (s-a)}{\sin c} \cos \frac{1}{2} \gamma;$$

$$\cos \frac{1}{2} \alpha \cos \frac{1}{2} \beta = \frac{\sin s}{\sin c} \sqrt{\frac{\sin (s-a) \sin (s-b)}{\sin a \sin b}} = \frac{\sin s}{\sin c} \sin \frac{1}{2} \gamma;$$

$$\sin \frac{1}{2} \alpha \sin \frac{1}{2} \beta = \frac{\sin (s-c)}{\sin c} \sqrt{\frac{\sin (s-a) \sin (s-b)}{\sin a \sin b}} = \frac{\sin s}{\sin c} \sin \frac{1}{2} \gamma;$$

$$\sin \frac{1}{2} \alpha \sin \frac{1}{2} \beta = \frac{\sin (s-c)}{\sin c} \sqrt{\frac{\sin (s-a) \sin (s-b)}{\sin a \sin b}}$$

$$= \frac{\sin (s-c)}{\sin c} \sin \frac{1}{2} \gamma.$$

$$(1) \sin \frac{1}{2} (\alpha + \beta) = \frac{\cos \frac{1}{2} \gamma}{\sin c} [\sin (s-b) + \sin (s-a)]$$

$$= \frac{\cos \frac{1}{2} \gamma \sin [s-\frac{1}{2} (a+b)] \cos \frac{1}{2} (a-b)}{\sin \frac{1}{2} c \cos \frac{1}{2} c}$$

$$= \frac{\cos \frac{1}{2} \gamma \cos \frac{1}{2} (a-b)}{\cos \frac{1}{2} c}.$$

$$\cos \frac{1}{2} c \cos \frac{1}{2} \cos \frac{1}{2} (\alpha + \beta) = \cos \frac{1}{2} \gamma \cos \frac{1}{2} (\alpha - b). \tag{1}$$

(2)
$$\cos \frac{1}{2} (\alpha + \beta) = \frac{\sin \frac{1}{2} \gamma}{\sin c} [\sin s - \sin (s - c)]$$

$$= \frac{\sin \frac{1}{2} \gamma \cos (s - \frac{1}{2} c) \sin \frac{1}{2} c}{\sin \frac{1}{2} c \cos \frac{1}{2} c}$$

$$= \frac{\sin \frac{1}{2} \gamma \cos \frac{1}{2} (a + b)}{\cos \frac{1}{2} c}.$$

$$\cdot \cdot \cos \frac{1}{2} c \cos \frac{1}{2} (\alpha + \beta) = \sin \frac{1}{2} \gamma \cos \frac{1}{2} (a + b).$$
(3) $\sin \frac{1}{2} (\alpha - \beta) = \frac{\cos \frac{1}{2} \gamma}{\sin c} [\sin (s - b) - \sin (s - a)]$

(3)
$$\sin \frac{1}{2}(\alpha - \beta) = \frac{\cos \frac{1}{2} \gamma}{\sin c} [\sin (s - b) - \sin (s - a)]$$

$$= \frac{\cos \frac{1}{2} \gamma \cos [s - \frac{1}{2}(a + b)] \sin \frac{1}{2}(a - b)}{\sin \frac{1}{2} c \cos \frac{1}{2} c}$$

$$= \frac{\cos \frac{1}{2} \gamma \sin \frac{1}{2}(a - b)}{\sin \frac{1}{2} c}.$$

$$\cdot \cdot \cdot \sin \frac{1}{2} c \sin \frac{1}{2} (\alpha - \beta) = \cos \frac{1}{2} \gamma \sin \frac{1}{2} (\alpha - b). \tag{3}$$

(4)
$$\cos \frac{1}{2} (\alpha - \beta) = \frac{\sin \frac{1}{2} \gamma}{\sin c} [\sin s + \sin (s - c)]$$

$$= \frac{\sin \frac{1}{2} \gamma \sin (s - \frac{1}{2} c) \cos \frac{1}{2} c}{\sin \frac{1}{2} c \cos \frac{1}{2} c}$$

$$= \frac{\sin \frac{1}{2} \gamma \sin \frac{1}{2} (a + b)}{\sin \frac{1}{2} c}.$$

$$\cdot \cdot \sin \frac{1}{2}c \cos \frac{1}{2}(\alpha - \beta) = \sin \frac{1}{2}\gamma \sin \frac{1}{2}(\alpha + b). \tag{4}$$

Eqs. (1), (2), (3), and (4) are known as Gauss's Equations, or Delambre's Analogies.

146. Rules for Species in Oblique Spherical Triangles.

(1) If a side (or angle) differs more than another side (or angle) from 90°, it is of the same species as its opposite angle (or side).

We wish to show that $\cos a$ and $\cos a$ will have the same sign when the difference between a and 90° is numerically greater than the difference between b and 90°. In the formula

$$\cos \alpha = \frac{\cos a - \cos b \cos c}{\sin b \sin c} \tag{1}$$

the denominator is always positive, so that the sign of the fraction, and hence that of $\cos \alpha$, is the same as that of the numera-

tor. But if a differs more than b from 90°, $\cos a$ is numerically greater than $\cos b$, and hence greater than $\cos b \cos c$, since $\cos c$ cannot exceed unity. Therefore the numerator has the same sign as $\cos a$; *i.e.* $\cos a$ and $\cos a$ have the same sign, so that a and a are in the same quadrant.

By a similar process, using the formula

$$\cos a = \frac{\cos \alpha + \cos \beta \cos \gamma}{\sin \beta \sin \gamma},\tag{2}$$

we can show that, when α differs more than β or γ from 90°, α and α are of the same species.

Since two sides will in general differ more than the third from 90°, two angles will in general be of the same species as their opposite sides. Thus, if $a = 140^{\circ}$, $b = 50^{\circ}$, and $c = 110^{\circ}$, we see that a and b differ more from 90° than c does; therefore a will lie in the second, and β in the first quadrant, while the quadrant of γ is not determined by this rule.

2. Half the sum of two sides must be of the same species as half the sum of the two opposite angles. — From (3), Art. 144,

$$\tan\frac{1}{2}(a+b) = \tan\frac{1}{2}c \frac{\cos\frac{1}{2}(a-\beta)}{\cos\frac{1}{2}(a+\beta)}.$$
 (3)

But e must be less than 180°; hence $\frac{1}{2}e$ must be less than 90°, so that $\tan \frac{1}{2}e$ is positive. Also, $\alpha - \beta$ must be numerically less than 180°; hence $\frac{1}{2}(\alpha - \beta)$ must be numerically less than 90°, so that $\cos \frac{1}{2}(\alpha - \beta)$ is always positive. Hence $\tan \frac{1}{2}(a+b)$ and $\cos \frac{1}{2}(\alpha + \beta)$ must have the same sign. But a + b and $\alpha + \beta$ must each be less than 360°; hence $\frac{1}{2}(a+b)$ and $\frac{1}{2}(\alpha + \beta)$ must each be less than 180°, so that they must be in the same quadrant in order that $\tan \frac{1}{2}(a+b)$ and $\cos \frac{1}{2}(\alpha + \beta)$ may have the same sign. Thus, if $\frac{1}{2}(\alpha + \beta)$ is in the first quadrant, its cosine will be positive; the second member of (2) will be positive, and therefore $\frac{1}{2}(\alpha + b)$ must be in the first quadrant. If $\cos \frac{1}{2}(\alpha + \beta)$ is negative, $\tan \frac{1}{2}(a+b)$ will be negative; therefore $\frac{1}{2}(\alpha + \beta)$ and $\frac{1}{2}(a + b)$ must both be in the second quadrant.

In the example under the first rule, after α and β have been computed, the quadrant in which γ will lie may be determined by the second rule.

147. Solution of Oblique Spherical Triangles. — Any spherical triangle may be solved by the use of the following formulas:

$$\frac{\sin \alpha}{\sin \alpha} = \frac{\sin b}{\sin \beta} = \frac{\sin c}{\sin \gamma}.$$
 (1)

$$\tan\frac{1}{2}\alpha = \frac{r}{\sin(s-a)}; \qquad r = \sqrt{\frac{\sin(s-a)\sin(s-b)\sin(s-c)}{\sin s}}. \quad (2)$$

$$\tan\frac{1}{2}a = R\cos(S - \alpha); R = \sqrt{\frac{-\cos S}{\cos(S - \alpha)\cos(S - \beta)\cos(S - \gamma)}}.$$
 (3)

$$\frac{\tan\frac{1}{2}(a-b)}{\tan\frac{1}{2}c} = \frac{\sin\frac{1}{2}(a-\beta)}{\sin\frac{1}{2}(a+\beta)}.$$
 (4)

$$\frac{\tan\frac{1}{2}(\alpha+b)}{\tan\frac{1}{2}c} = \frac{\cos\frac{1}{2}(\alpha-\beta)}{\cos\frac{1}{2}(\alpha+\beta)}.$$
 (5)

$$\frac{\tan\frac{1}{2}(\alpha-\beta)}{\cot\frac{1}{2}\gamma} = \frac{\sin\frac{1}{2}(a-b)}{\sin\frac{1}{2}(a+b)}.$$
 (6)

$$\frac{\tan\frac{1}{2}(\alpha+\beta)}{\cot\frac{1}{2}\gamma} = \frac{\cos\frac{1}{2}(a-b)}{\cos\frac{1}{2}(a+b)}$$
(7)

There are six possible cases:

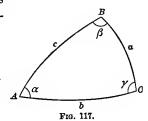

- I. Given the three sides.
- II. Given the three angles.
- III. Given two sides and the included angle.
- IV. Given two angles and the included side.
 - V. Given two sides and the angle opposite one of them.
- VI. Given two angles and the side opposite one of them.

148. Case I. Given the Three Sides (a, b, c). — Find the angles by the formulas

$$r = \sqrt{\frac{\sin(s-a)\sin(s-b)\sin(s-c)}{\sin s}},$$

$$\tan \frac{1}{2}\alpha = \frac{r}{\sin(s-a)}.$$

Check by the sine proportion.

1. Solve the triangle when $a = 114^{\circ} 43'.3$, $b = 136^{\circ} 19'.6$, $c = 43^{\circ} 18'.5$.

In finding $\log \tan \frac{1}{2}\alpha$ write $\log r$ on the margin of a slip of paper, place it above $\log \sin (s-a)$, and write the difference opposite $\log \tan \frac{1}{2}\alpha$; then find $\log \tan \frac{1}{2}\beta$ and $\log \tan \frac{1}{2}\gamma$ in the same manner.

2.
$$a = 76^{\circ} 40'.4$$
, $b = 54^{\circ} 21'.3$, $c = 36^{\circ} 8'.7$.
 $\therefore \frac{1}{2} a = 60^{\circ} 1'.8$; $\frac{1}{2} \beta = 23^{\circ} 8'.6$; $\frac{1}{2} \gamma = 15^{\circ} 49'.3$.

3.
$$a = 124^{\circ} 34'.9$$
, $b = 66^{\circ} 7'.2$, $c = 109^{\circ} 43'.5$.

$$\therefore \frac{1}{2} \alpha = 60^{\circ} 1'.3; \frac{1}{2} \beta = 37^{\circ} 0'.8; \frac{1}{2} \gamma = 49^{\circ} 6'.8.$$

4. $a = 30^{\circ} 17'.6$, $b = 22^{\circ} 14'.4$, $c = 18^{\circ} 51'.8$.

...
$$\frac{1}{2}\alpha = 47^{\circ} 55'.0$$
; $\frac{1}{2}\beta = 24^{\circ} 8'.5$; $\frac{1}{2}\gamma = 19^{\circ} 48'.45$.

5. $a = 130^{\circ} 46'.0$, $b = 113^{\circ} 21'.4$, $c = 102^{\circ} 16'.2$.

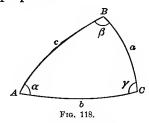

:.
$$\frac{1}{2} \alpha = 72^{\circ} 38'.0$$
; $\frac{1}{2} \beta = 68^{\circ} 9'.6$; $\frac{1}{2} \gamma = 66^{\circ} 20'.5$.

149. Case II. Given the Three Angles (a, β, γ) . — Find the sides by the formulas

$$R = \sqrt{\frac{-\cos S}{\cos (S - \alpha) \cos (S - \beta) \cos (S - \gamma)}},$$

$$\tan \frac{1}{2} a = R \cos (S - \alpha).$$

Check by the sine proportion.

1. Solve the triangle when $\alpha = 116^{\circ} 19'.4$, $\beta = 83^{\circ} 19'.2$, $\gamma = 106^{\circ} 10'.6$.

In finding $\log \tan \frac{1}{2} a$, write $\log R$ on the margin of a slip of paper, place it above $\log \cos (S - a)$, and write the sum opposite $\log \tan \frac{1}{2} a$; then find $\log \tan \frac{1}{2} b$ and $\log \tan \frac{1}{2} c$ in a similar manner.

2.
$$\alpha = 110^{\circ} 36'.4$$
, $\beta = 122^{\circ} 8'.7$, $\gamma = 140^{\circ} 20'.3$.

...
$$\frac{1}{2}a = 41^{\circ}56'.3$$
; $\frac{1}{2}b = 57^{\circ}57'.5$; $\frac{1}{2}c = 68^{\circ}39'.4$.

3.
$$\alpha = 120^{\circ} 50'.6$$
, $\beta = 78^{\circ} 6'.1$, $\gamma = 81^{\circ} 12'.3$.

$$\cdot \cdot \cdot \, \frac{1}{2} \, a = 59^{\circ} \, 55'.2$$
 ; $\frac{1}{2} \, b = 40^{\circ} \, 40'.1$; $\frac{1}{2} \, c = 43^{\circ} \, 23'.4.$

4.
$$\alpha = 80^{\circ} 20'.2$$
, $\beta = 73^{\circ} 46'.7$, $\gamma = 54^{\circ} 8'.5$.

$$\therefore \frac{1}{2}a = 32^{\circ}23'.6$$
; $\frac{1}{2}b = 30^{\circ}53'.7$; $\frac{1}{2}c = 24^{\circ}1'.7$.

5.
$$\alpha = 100^{\circ} 51'.3$$
, $\beta = 80^{\circ} 47'.6$, $\gamma = 74^{\circ} 3'.3$.

$$a = 49^{\circ} 22'.4$$
; $\frac{1}{2}b = 41^{\circ} 42'.5$; $\frac{1}{2}c = 37^{\circ} 41'.6$.

150. Case III. Given Two Sides and the Included Angle (b, c, a). — By permuting (6) and (7), Art. 147, we have

$$\tan \frac{1}{2} (\beta - \gamma) = \cot \frac{1}{2} \alpha \frac{\sin \frac{1}{2} (b - c)}{\sin \frac{1}{2} (b + c)},$$
(1)

$$\tan\frac{1}{2}(\beta+\gamma) = \cot\frac{1}{2}\alpha \frac{\cos\frac{1}{2}(b-c)}{\cos\frac{1}{2}(b+c)}.$$
 (2)

Then

$$\beta = \frac{1}{2} (\beta + \gamma) + \frac{1}{2} (\beta - \gamma),$$

$$\gamma = \frac{1}{2} (\beta + \gamma) - \frac{1}{2} (\beta - \gamma).$$

Note that the larger angle must be opposite the larger side.

To obtain a, we permute (4) and (5), Art. 147:

$$\tan \frac{1}{2} a = \tan \frac{1}{2} (b - c) \frac{\sin \frac{1}{2} (\beta + \gamma)}{\sin \frac{1}{2} (\beta - \gamma)},$$
 (3)

$$\tan \frac{1}{2} \alpha = \tan \frac{1}{2} (b+c) \frac{\cos \frac{1}{2} (\beta+\gamma)}{\cos \frac{1}{2} (\beta-\gamma)}.$$
 (4)

The agreement of the values of $\frac{1}{2}a$ found from (3) and (4) is a check upon the computation. The sine proportion may also be used as a check.

Note. — In using these formulas, the larger side and the larger angle should be written first in the expressions b-c and $\beta-\gamma$. Thus for c>b, (1) would be written

$$\tan \frac{1}{2} (\gamma - \beta) = \cot \frac{1}{2} \alpha \frac{\sin \frac{1}{2} (c - b)}{\sin \frac{1}{2} (c + b)}.$$

Eq. (1) may be read: "The tangent of half the difference of the required angles is equal to the cotangent of half the given angle, multiplied by the sine of half the difference of the given sides, and divided by the sine of half their sum."

1. Solve the triangle when $b = 105^{\circ} 14'.8$, $c = 43^{\circ} 17'.2$, $a = 112^{\circ} 47'.4$.

- **2.** $a = 103^{\circ} 44'.7$, $b = 64^{\circ} 12'.3$, $\gamma = 98^{\circ} 33'.8$. $\frac{1}{2}(\alpha + \beta) = 82^{\circ} 37'.0$; $\frac{1}{2}(\alpha - \beta) = 16^{\circ} 19'.0$; $\alpha = 98^{\circ} 56'.0$; $\beta = 66^{\circ} 18'.0$; $\frac{1}{2} c = 51^{\circ} 45'.3$.
- 3. $a = 156^{\circ} 12'.2$, $b = 112^{\circ} 48'.6$, $\gamma = 76^{\circ} 32'.4$. $\therefore \frac{1}{2}(\alpha + \beta) = 120^{\circ} 45'.6$; $\frac{1}{2}(\alpha - \beta) = 33^{\circ} 18'.5$; $\alpha = 154^{\circ} 4'.1$; $\beta = 87^{\circ} \, 27' \cdot 1$; $\frac{1}{2} \, c = 31^{\circ} \, 54' \cdot 4$.
- 151. Case III. Second Method. Given b, c, a, to find One Element only.
 - (1) To find a only.

 $\cos a = \cos b \cos c + \sin b \sin c \cos \alpha$.

Let

$$\begin{aligned}
m & \sin M = \sin c \cos \alpha, \\
m & \cos M = \cos c.
\end{aligned}$$
(1)

 $\therefore \cos a = m(\cos b \cos M + \sin b \sin M).$

$$\therefore \cos a = m \cos (b - M). \tag{2}$$

(2) To find one angle only, β or γ . — From (6), Art. 124, $\sin \alpha \cot \gamma = \cot c \sin b - \cos b \cos \alpha$.

$$\therefore \cot \gamma = \frac{\cot c \sin b - \cos b \cos \alpha}{\sin \alpha} = \frac{\cos c \sin b - \cos b \sin c \cos \alpha}{\sin \alpha \sin c}.$$

* The functions of $\frac{1}{2}(\beta-\gamma)$ and of $\frac{1}{2}(\beta+\gamma)$ should be found by using the fraction from which the decimal of a minute is found. Thus,

$$\log \sin \frac{1}{2} (\beta + \gamma) = 9.95561 + \frac{29}{33} \times 6 = 9.95561 + 5 = 9.95566.$$

Let

$$\begin{array}{l}
 m \sin M = \sin c \cos \alpha, \\
 m \cos M = \cos c.
 \end{array}$$
(3)

$$\therefore \cot \gamma = \frac{m \sin (b - M)}{\sin \alpha \sin c}.$$
 (4)

The formula for $\cot \beta$ may be found by permuting b and c in (3) and (4).

1. $b = 105^{\circ} 14'.8$, $c = 43^{\circ} 17'.2$, $\alpha = 112^{\circ} 47'.4$.

To find a. To find
$$\gamma$$
. To find β . log sin $c=9.83611$ (1) log sin $c=$ (1) log sin $b=9.98444$ log cos $a=9.58811$ n (3) log cos $a=$ (3) log cos $a=9.58811$ n log(m sin M) log(m·sin M) log(m·sin M) = 9.42422 n (4) = (5) = 9.57255 n log sin $M=9.53499$ n (7) log sin $M=$ (8) log sin $M=9.91266$ n log cos $M=9.97286$ (8) log cos $M=9.97286$ (8) log cos $M=9.97286$ (8) log cos $M=9.97286$ (9) log cos $M=9.97286$ (9) log cos $M=9.97286$ log tan $M=9.56213$ n (5) log tan $M=9.56213$ n (6) log tan $M=9.56213$ n (6) log tan $M=0.15263$ log tan $M=9.56213$ n (6) log tan $M=0.15263$ log cos $M=0.15263$ log sin $M=0.15263$ log cos $M=0.15263$

- **2.** $a = 103^{\circ} 44'.7$, $b = 64^{\circ} 12'.3$, $\gamma = 98^{\circ} 33'.8$.
- $M = 211^{\circ} 19'.8$, $c = 103^{\circ} 30'.6$, $\alpha = 98^{\circ} 56'.0$; $M = -17^{\circ} 7'.4$, $\beta = 66^{\circ} 18'.0$.
- 3. $a = 156^{\circ} 12'.2$, $b = 112^{\circ} 48'.6$, $\gamma = 76^{\circ} 32'.4$.
- $M = 174^{\circ} 8'.4$, $c = 63^{\circ} 48'.9$, $a = 154^{\circ} 4'.2$; $M = 151^{\circ} 2'.3$, $\beta = 87^{\circ} 27'.1$.

152. Case IV. Given Two Angles and the Included Side (a, β , c).—From (4) and (5), Art. 147, we have

$$\tan \frac{1}{2}(a-b) = \tan \frac{1}{2} c \frac{\sin \frac{1}{2}(a-\beta)}{\sin \frac{1}{2}(a+\beta)},$$
 (1)

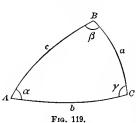

$$\tan \frac{1}{2}(a+b) = \tan \frac{1}{2} c \frac{\cos \frac{1}{2}(a-\beta)}{\cos \frac{1}{2}(a+\beta)}.$$
 (2)

Then

$$a = \frac{1}{2}(a+b) + \frac{1}{2}(a-b),$$

$$b = \frac{1}{2}(a+b) - \frac{1}{2}(a+b)$$
.

To obtain y, use (6) and (7), Art. 147:

$$\cot \frac{1}{2} \gamma = \tan \frac{1}{2} (\alpha - \beta) \frac{\sin \frac{1}{2} (a + b)}{\sin \frac{1}{2} (a - b)}, \quad (3)$$
$$\cot \frac{1}{2} \gamma = \tan \frac{1}{2} (\alpha + \beta) \frac{\cos \frac{1}{2} (a + b)}{\cos \frac{1}{2} (a - b)}. \quad (4)$$

$$\cot \frac{1}{2} \gamma = \tan \frac{1}{2} (\alpha + \beta) \frac{\cos \frac{1}{2} (a + b)}{\cos \frac{1}{2} (a - b)}. \tag{4}$$

The agreement of the values of $\frac{1}{2}\gamma$ found from (3) and (4) is a check upon the computation. The sine proportion may also be used as a check.

See the note, Art. 150.

1. Solve the triangle when $\alpha = 104^{\circ} 30'.7$, $\beta = 62^{\circ} 52'.1$, $c = 56^{\circ} 6'.4$.

2. $\alpha = 140^{\circ} 43'.2$, $\beta = 100^{\circ} 4'.6$, $c = 60^{\circ} 43'.6$.

$$\therefore \frac{1}{2}(a+b) = 132^{\circ} 38'.88$$
; $\frac{1}{2}(a-b) = 13^{\circ} 16'.32$; $a = 145^{\circ} 55'.20$; $b = 119^{\circ} 22'.56$; $\frac{1}{2}\gamma = 40^{\circ} 7'.42$.

3. $\alpha = 140^{\circ} 24'.6$, $\beta = 12^{\circ} 18'.6$, $c = 28^{\circ} 7'.7$.

153. Case IV. Second Method. Given β , γ , α , to find One Element only.

(1) To find a only.

$$\cos \alpha = -\cos \beta \cos \gamma + \sin \beta \sin \gamma \cos \alpha.$$

$$m \sin M = \sin \gamma \cos \alpha,$$

$$m \cos M = \cos \gamma.$$
(1)

Let

$$\therefore \cos \alpha = -m(\cos \beta \cos M - \sin \beta \sin M).$$

$$\therefore \cos \alpha = -m \cos (M + \beta). \tag{2}$$

(2) To find one side only, b or c. — Permuting (6), Art. 124,

 $\sin\beta\cot\gamma=\cot c\sin a-\cos a\cos\beta.$

$$\therefore \cot c = \frac{\sin \beta \cot \gamma + \cos a \cos \beta}{\sin a} = \frac{\sin \beta \cos \gamma + \cos a \cos \beta \sin \gamma}{\sin a \sin \gamma}.$$

Let

$$\left.\begin{array}{l}
m\sin M = \sin\gamma\cos a, \\
m\cos M = \cos\gamma.
\end{array}\right\} \tag{3}$$

$$\therefore \cot c = \frac{m \sin (M + \beta)}{\sin a \sin \gamma}.$$
 (4)

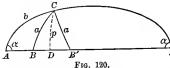

The formula for $\cot b$ may be found by permuting b and c in (3) and (4).

1. $\beta = 140^{\circ} 43'.2$, $\gamma = 100^{\circ} 4'.6$, $\alpha = 60^{\circ} 43'.6$.

154. Case V. Given Two Sides and the Angle Opposite One

of them (a, b, a).—Find β by the sine proportion,

$$\sin \beta = \sin b \, \frac{\sin \alpha}{\sin a}. \tag{1}$$

Find c by (4) and (5), Art. 147,

$$\tan \frac{1}{2}c = \tan \frac{1}{2}(a-b)\frac{\sin \frac{1}{2}(\alpha+\beta)}{\sin \frac{1}{2}(\alpha-\beta)},$$
 (2)

$$\tan \frac{1}{2}c = \tan \frac{1}{2}(a+b) \frac{\cos \frac{1}{2}(\alpha+\beta)}{\cos \frac{1}{2}(\alpha-\beta)}.$$
 (3)

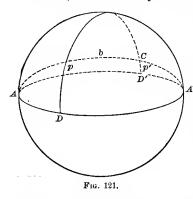

Find γ by (6) and (7), Art. 147,

$$\cot \frac{1}{2} \gamma = \tan \frac{1}{2} (\alpha - \beta) \frac{\sin \frac{1}{2} (a + b)}{\sin \frac{1}{2} (a - b)},$$
 (4)

$$\cot \frac{1}{2} \gamma = \tan \frac{1}{2} (\alpha + \beta) \frac{\cos \frac{1}{2} (a + b)}{\cos \frac{1}{2} (a - b)}.$$
 (5)

The agreement of the values of $\frac{1}{2}c$ and of $\frac{1}{2}\gamma$ is a check upon the computation.

Since β is found by means of its sine, it may be either in

the first or in the second quadrant; hence there may be two solutions. If b differs more than a from 90°, β must be of the same species as b, and the quadrant in which β lies is fixed. But if b does not differ more than a from 90°, we cannot determine by the first rule for species the quadrant in which β must lie, and both values of β may be admissible. Hence, in-

spect for two solutions when the side opposite the required angle differs less from 90° than the side opposite the given angle. After finding β , the second rule of Art. 146 will show whether both values are admissible.

1. Solve the triangle when $a=148^{\circ}34'.4$, $b=142^{\circ}11'.6$, $\alpha=153^{\circ}17'.6$. Since b differs less than a from 90°, there may be two solutions.

The second rule for species is satisfied for both β and β' ; hence there are two solutions.

First. Second. log
$$\tan \frac{1}{2}(a-b)=8.74612$$
 or 8.74612 log $\sin \frac{1}{2}(a+\beta)=9.99955$ 9.68966 col $\sin \frac{1}{2}(a-\beta)=\frac{0.05945}{8.80512}$ 9.78005 $\frac{1}{2}c=3^{\circ}39'.18$ $c=7^{\circ}18'.36$ or $9.83903n$ log $\cos \frac{1}{2}(a+b)=9.83903n$ or $9.83903n$ log $\cos \frac{1}{2}(a+\beta)=8.65573n$ col $\cos \frac{1}{2}(a-\beta)=\frac{0.31034}{8.80510}$ 9.94055 n col $\cos \frac{1}{2}(a-\beta)=\frac{0.31034}{8.80510}$ 9.78003 $\frac{1}{2}c=3^{\circ}39'.17$ $c=7^{\circ}18'.34$ or $\frac{1}{2}c=3^{\circ}39'.17$ $c=7^{\circ}18'.34$ or $\frac{1}{2}(a-\beta)=0.25089$ or $\frac{1}{2}(a+b)=9.75441$ col $\sin \frac{1}{2}(a-b)=\frac{1.25456}{1.25986}$ log $\cot \frac{1}{2}\gamma=\frac{1.25986}{1.25986}$ 0r $\frac{1.25456}{9.66514}$ 9.75491 n log $\cot \frac{1}{2}(a+\beta)=0.91538n$ or $\frac{1}{2}(a+b)=0.91538n$ col $\cos \frac{1}{2}(a-b)=\frac{0.00067}{1.25988}$ 10g $\cot \frac{1}{2}\gamma=\frac{1.25988}{1.25988}$ 0r $\frac{0.00067}{0.66516}$ 10g $\cot \frac{1}{2}\gamma=\frac{1.25988}{1.25988}$ 0r $\frac{0.00067}{0.66516}$ 0.00067 0.00067 0.00067 0.66510.62 $\frac{1}{2}\gamma=3^{\circ}8'.78$ 0.00067 0.0006

- 155. Case V. Second Method. Given a, b, a, to find One Element only.
 - (1) To find β only. $\sin \beta = \frac{\sin b}{\sin a} \sin \alpha.$ (1)

^{*} These values would be taken, since a small error in β will affect them less than if they had been computed from the other formulas.

(2) To find c only.

 $\cos b \cos c + \sin b \sin c \cos \alpha = \cos \alpha$.

Let

$$\left.\begin{array}{l}
m\sin M = \sin b\cos \alpha, \\
m\cos M = \cos b
\end{array}\right\} \tag{2}$$

 $m \cos(M-c) = \cos a$.

$$\therefore \cos(M-c) = \frac{\cos a}{m}.$$
 (3)

M-c may be either in the first and fourth quadrants or in the second and third; if there are two solutions both values of M-c will give $c<180^{\circ}$.

(3) To find
$$\gamma$$
 only. — From (7), Art. 124, $\cos b \cos \gamma + \sin \gamma \cot \alpha = \cot \alpha \sin b$.

 \therefore $\cos b \sin a \cos \gamma + \sin \gamma \cos a = \cot a \sin b \sin a$.

Let

$$\begin{array}{l}
 m \sin M = \cos b \sin \alpha, \\
 m \cos M = \cos \alpha.
\end{array}$$
(4)

 $\therefore m\sin(M+\gamma) = \cot a \sin b \sin \alpha.$

$$\therefore \sin(M+\gamma) = \frac{\cot a \sin b \sin a}{m}.$$
 (5)

 $M + \gamma$ may be either in the first and second quadrants or in the third and fourth; if there are two solutions, both values of $M + \gamma$ will give $\gamma < 180^{\circ}$.

1. $a = 148^{\circ} 34'.4$, $b = 142^{\circ} 11'.6$, $a = 153^{\circ} 17'.6$.

To find c. log sin
$$b = 9.78746$$

156. Case VI. Given Two Angles and the Side Opposite One of them (a, β, a) . — Find b by the sine proportion,

$$\sin b = \sin \beta \frac{\sin a}{\sin a} \tag{1}$$

Find c by (4) and (5), Art. 147,

$$\tan \frac{1}{2} c = \tan \frac{1}{2} (a - b) \frac{\sin \frac{1}{2} (\alpha + \beta)}{\sin \frac{1}{2} (\alpha - \beta)},$$
 (2)

$$\tan \frac{1}{2} c = \tan \frac{1}{2} (a+b) \frac{\cos \frac{1}{2} (\alpha+\beta)}{\cos \frac{1}{2} (\alpha-\beta)}.$$
 (3)

Find γ by (6) and (7), Art. 147,

$$\cot \frac{1}{2} \gamma = \tan \frac{1}{2} (\alpha - \beta) \frac{\sin \frac{1}{2} (a + b)}{\sin \frac{1}{2} (a - b)}, \tag{4}$$

$$\cot \frac{1}{2}\gamma = \tan \frac{1}{2}(\alpha + \beta) \frac{\cos \frac{1}{2}(\alpha + b)}{\cos \frac{1}{2}(\alpha - b)}.$$
 (5)

The agreement of the values of $\frac{1}{2}c$ and of $\frac{1}{2}\gamma$ is a check upon the computation.

Since b is found by means of its sine, it may be either in the first or in the second quadrant; hence there may be two solutions. If β differs more than α from 90°, β and b must be of the same species, and the quadrant in which b lies is fixed. But if β does not differ more than α from 90°, we cannot determine by the first rule for species the quadrant in which b must lie, and both values of b may be admissible. Hence, inspect for two solutions when the angle opposite the required side differs less from 90° than the angle opposite the given side. After finding b, the second rule of Art. 146 will show whether both values are admissible.

1. Solve the triangle when $\alpha = 143^{\circ} 17'.4$, $\beta = 70^{\circ} 18'.4$, $\alpha = 160^{\circ} 40'.6$. Since β differs less than α from 90°, there may be two solutions.

 $b' = 148^{\circ} 35'.3$

The second rule for species is satisfied for both b and b'; hence there are two solutions.

First. Second. log
$$\tan \frac{1}{2}(a-b) = 0.32409$$

$c' = 147^{\circ} 10'.6$	(17)		

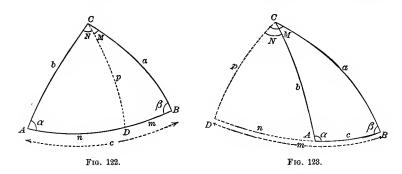

Two values.

2.
$$\alpha = 117^{\circ} 54'.4$$
, $\beta = 45^{\circ} 8'.6$, $\alpha = 76^{\circ} 37'.5$.
 $\therefore M = 71^{\circ} 22'.3$, $c = 41^{\circ} 4'.9$; $M = 13^{\circ} 5'.3$, $\gamma = 36^{\circ} 38'.8$.

3.
$$\alpha = 104^{\circ} 40'.0$$
, $\beta = 80^{\circ} 13'.6$, $\alpha = 126^{\circ} 50'.4$.
. $M = 167^{\circ} 14'.0$, $c = 147^{\circ} 36'.9$ or $6^{\circ} 51'.1$; $M = -73^{\circ} 58'.3$, $\gamma = 139^{\circ} 39'.0$ or $8^{\circ} 17'.6$.

OBLIQUE TRIANGLES SOLVED BY RIGHT TRIANGLES.

158. General Method. — From any vertex C of the triangle draw an arc p of a great circle perpendicular to the opposite

side, dividing the triangle into two right triangles. Denote the segments of the side by m and n, and the corresponding segments of the angle by M and N.

The opposite side must in some cases be produced to meet the perpendicular arc, as in Fig. 123. The segments of the side are AD and DB, and their signs are so taken that their algebraic sum shall be equal to the side; that is, if a segment is entirely exterior to the triangle, it is negative.

The perpendicular p may have either of two supplemental values; we shall always place it in the same quadrant as its opposite angle in the triangle first used in the solution, in accordance with the rule for species.

159. Special Formula. — To prove

$$\tan \frac{1}{2}(m+n) \tan \frac{1}{2}(m-n) = \tan \frac{1}{2}(a+b) \tan \frac{1}{2}(a-b)$$
. (1)

In both Fig. 122 and Fig. 123, by Napier's rules,

 $\cos a = \cos m \cos p$, and $\cos b = \cos n \cos p$.

which becomes, from (4) and (3), Art. 73,

 $\tan \frac{1}{2}(m+n)\tan \frac{1}{2}(m-n) = \tan \frac{1}{2}(a+b)\tan \frac{1}{2}(a-b)$. Q.E.D.

160. Case I. Given a, b, c. — From (1), Art. 159, we have

$$\tan \frac{1}{2}(m-n) = \tan \frac{1}{2}(a+b) \tan \frac{1}{2}(a-b) \cot \frac{1}{2}c,$$
 (1)

since m + n = c. We shall consider $\frac{1}{2}(m - n)$ as being numerically less than 90°, so that it will be a negative angle when its tangent is negative. After $\frac{1}{2}(m - n)$ has been found, we have

$$m = \frac{1}{2}c + \frac{1}{2}(m-n), n = \frac{1}{2}c - \frac{1}{2}(m-n).$$
 (2)

A negative value of m or of n indicates that the segment, and hence the corresponding triangle, is exterior to the given triangle. Note that m is always measured from the side that is called a, and n from b.

In the triangles ACD and DCB we now know the two sides, so that the other elements can be found by Napier's rules. The example shows the method of finding the elements of the original triangle from the results of the computation.

1. $a = 114^{\circ} 43'.3$, $b = 136^{\circ} 19'.6$, $c = 43^{\circ} 18'.5$.

From (1), $\frac{1}{2}(m-n)=33^{\circ}\,56'.81$, whence $m=55^{\circ}\,36'.06$, $n=-12^{\circ}\,17'.56$. The negative value of n shows that ACD is exterior to the triangle.

From BCD we find $DBC = \beta = 132^{\circ} 15'.3$, $DCB = M = 65^{\circ} 17'.0$.

From ACD we find $DAC=180^{\circ}-\alpha=103^{\circ}$ 11'.6, $ACD=N=-17^{\circ}$ 57'.5, giving N the negative sign since it is exterior to the triangle. Hence

$$\alpha = 76^{\circ} 48'.4$$
; $\gamma = M + N = 47^{\circ} 19'.5$.

2. $a = 76^{\circ} 40'.4$, $b = 54^{\circ} 21'.3$, $c = 36^{\circ} 8'.7$.

...
$$\frac{1}{2}(m-n) = 53^{\circ}0'.38$$
; $m = 71^{\circ}4'.73$; $n = -34^{\circ}56'.03$; $\beta = 46^{\circ}17'.3$; $M = 76^{\circ}27'.0$; $N = -44^{\circ}48'.2$; $\gamma = 31^{\circ}38'.8$; $\alpha = 120^{\circ}3'.6$.

- **3.** $a = 124^{\circ} 34'.9$, $b = 66^{\circ} 7'.2$, $c = 109^{\circ} 43'.5$.
- $\begin{array}{l} \therefore \ \ \frac{1}{2} \ (m-n) = -76^{\circ} \ 37'.32 \ ; \ m = -21^{\circ} \ 45'.57 \ ; \ n = +131^{\circ} \ 29'.07 \ ; \ \beta = 74^{\circ} \ 1'.7 \ ; \\ M = -26^{\circ} \ 45'.6 \ ; \ \alpha = 120^{\circ} \ 2'.7 \ ; \ N = +124^{\circ} \ 59'.2 \ ; \ \gamma = 98^{\circ} \ 13'.6. \end{array}$
 - **4.** $a = 30^{\circ} 17'.6$, $b = 22^{\circ} 14'.4$, $c = 18^{\circ} 51'.8$.

..
$$m = 21^{\circ} 14'.6$$
; $n = -2^{\circ} 22'.8$; $\beta = 48^{\circ} 17'.1$; $M = 45^{\circ} 54'.8$; $\alpha = 95^{\circ} 50'.0$; $N = -6^{\circ} 17'.9$; $\gamma = 39^{\circ} 36'.9$.

5. $a = 130^{\circ} 46'.0$, $b = 113^{\circ} 21'.4$, $c = 102^{\circ} 16'.2$.

...
$$\frac{1}{2}(m-n) = -11^{\circ} 8'.6$$
; $m = 39^{\circ} 59'.5$; $n = 62^{\circ} 16'.7$; $\beta = 136^{\circ} 19'.25$; $M = 58^{\circ} 3'.4$; $\alpha = 145^{\circ} 15'.9$; $N = 74^{\circ} 37'.75$; $\gamma = 132^{\circ} 41'.2$.

- 161. Case II. Given α , β , γ . Apply the method of Case I to the polar triangle, and thence find the elements of the original triangle.
 - 1. $\alpha = 116^{\circ} 19'.4$, $\beta = 83^{\circ} 19'.2$, $\gamma = 106^{\circ} 10'.6$.

In the polar triangle,

$$a' = 63^{\circ} 40'.6$$
, $b' = 96^{\circ} 40'.8$, $c' = 73^{\circ} 49'.4$.

$$\therefore \frac{1}{2}(m'-n') = -66^{\circ} 18'.1, m' = -29^{\circ} 23'.4, n' = +103^{\circ} 12'.8.$$

The negative value of m' shows that B'C'D' is exterior to the triangle.

From B'C'D' we find

$$D'B'C' = 180^{\circ} - \beta' = 73^{\circ} 49'.2, \ D'C'B' = M' = -33^{\circ} 11'.8,$$

giving M' the negative sign since it is exterior to the triangle.

From A'C'D' we find

$$D'A'C' = \alpha' = 60^{\circ} 4'.7, \ N' = +101^{\circ} 25'.5.$$

...
$$\beta' = 106^{\circ} 10'.8$$
, $\gamma' = M' + N' = 68^{\circ} 13'.7$.

Passing from the polar to the original triangle,

$$a = 119^{\circ} 55'.3$$
; $b = 73^{\circ} 49'.2$; $c = 111^{\circ} 46'.3$.

- **2**. $\alpha = 110^{\circ} 36'.4$, $\beta = 122^{\circ} 8'.7$, $\gamma = 140^{\circ} 20'.3$.
- $\therefore \frac{1}{2}(m'-n') = 29^{\circ} 27'.90; m' = 49^{\circ} 17'.75; n' = -9^{\circ} 38'.05;$

$$\beta' = 64^{\circ} 4'.9$$
; $M' = 54^{\circ} 5'.4$; $\alpha' = 96^{\circ} 7'.4$; $N' = -11^{\circ} 24'.0$; $\gamma' = 42^{\circ} 41'.4$; $\alpha = 83^{\circ} 52'.6$, $b = 115^{\circ} 55'.1$, $c = 137^{\circ} 18'.6$.

- **3.** $\alpha = 120^{\circ} 50'.6$, $\beta = 78^{\circ} 6'.1$, $\gamma = 81^{\circ} 12'.3$.
- $\begin{array}{c} ... \ \ \frac{1}{2} \left(m'-n'\right) = -\ 63^{\circ}\ 33'.19\ ; \ m' = -\ 14^{\circ}\ 9'.34\ ; \ n' = 112^{\circ}\ 57'.04\ ; \\ \beta' = 98^{\circ}\ 39'.7\ ; \ M' = -\ 16^{\circ}\ 33'.0\ ; \ \alpha' = 60^{\circ}\ 9'.6\ ; \\ N' = 109^{\circ}\ 46'.0\ ; \ \gamma' = 93^{\circ}\ 13'.0\ ; \end{array}$

$$a = 119^{\circ} 50'.4$$
, $b = 81^{\circ} 20'.3$, $c = 86^{\circ} 47'.0$.

- 4. $\alpha = 80^{\circ} 20'.2$, $\beta = 73^{\circ} 46'.7$, $\gamma = 54^{\circ} 8'.5$.

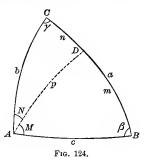

$$\therefore$$
 $a = 64^{\circ} 47'.2$, $b = 61^{\circ} 47'.3$, $c = 48^{\circ} 3'.4$.

5.
$$\alpha = 100^{\circ} 51'.3$$
, $\beta = 80^{\circ} 47'.6$, $\gamma = 74^{\circ} 3'.3$.
 $\therefore \frac{1}{2}(m' - n') = -83^{\circ} 50'.76$; $m' = -30^{\circ} 52'.41$; $n' = 136^{\circ} 49'.11$; $\beta' = 96^{\circ} 35'.0$; $M' = -31^{\circ} 30'.0$; $\alpha' = 81^{\circ} 15'.1$; $N' = 136^{\circ} 6'.8$; $\gamma' = 104^{\circ} 36'.8$; $\alpha = 98^{\circ} 44'.9$, $\beta = 83^{\circ} 25'.0$, $\beta = 75^{\circ} 23'.2$.

162. Case III. Given a, b, γ . — From the end of one of the sides, as b, let fall an arc of a great circle perpendicular to the

other side. In the triangle DAC we know b and γ ; hence we find n, N, and p by Napier's rules, considering p as of the same species as γ . Then m = a - n, being negative when n > a, showing that the triangle BAD is then exterior to the triangle BAC.

Now in the triangle BAD we know DB and AD, and we find c, M, and ABD by Napier's rules.

1.
$$a = 105^{\circ} 14'.8$$
, $b = 43^{\circ} 17'.2$, $\gamma = 112^{\circ} 47'.4$.

$$\therefore n = 159^{\circ} 57'.3, N = 150^{\circ} 0'.4, p = 140^{\circ} 47'.53.$$

$$m = -54^{\circ} 42'.5$$
, showing that BAD is exterior to BAC.

In the triangle BAD we find

 $ABD=180^{\circ}-\beta=135^{\circ}~0'.8,~c=116^{\circ}~35'.6,~M=-65^{\circ}~53'.7,$ giving M the negative sign since it is exterior to the triangle.

Hence
$$\beta = 44^{\circ} 59'.2$$
, $\alpha = N + M = 84^{\circ} 6'.7$.

2.
$$a = 103^{\circ} 44'.7$$
, $b = 64^{\circ} 12'.3$, $\gamma = 98^{\circ} 33'.8$.

...
$$N = 160^{\circ} 54'.7$$
; $n = 162^{\circ} 52'.6$; $p = 117^{\circ} 5'.1$; $m = -59^{\circ} 7'.9$; $c = 103^{\circ} 30'.6$; $\beta = 66^{\circ} 18'.0$; $M = -61^{\circ} 58'.7$; $\alpha = 98^{\circ} 56'.0$.

3.
$$a = 156^{\circ} 12'.2$$
, $b = 112^{\circ} 48'.6$, $\gamma = 76^{\circ} 32'.4$.

..
$$N = 148^{\circ} 18'.6$$
; $n = 151^{\circ} 2'.3$; $p = 63^{\circ} 41'.8$; $m = 5^{\circ} 9'.9$; $c = 63^{\circ} 48'.8$; $\beta = 87^{\circ} 27'.1$; $M = 5^{\circ} 45'.5$; $\alpha = 154^{\circ} 4'.1$.

163. Case IV. Given α , β , c.—Let fall from the vertex of one of the angles, as $\alpha = BAC$ (Fig. 124), an arc of a great circle perpendicular to the opposite side. In the triangle ABD we know c and β , and we find m, M, and p by Napier's rules, considering p as of the same species as β . Then $N = \alpha - M$, a negative value of N showing that the point D lies on BC produced, the triangle ACD being then exterior to the given triangle.

In the triangle ACD we now know p and CAD, and we find b, γ , and n by Napier's rules.

1.
$$\alpha = 140^{\circ} 43'.2$$
, $\beta = 100^{\circ} 4'.6$, $c = 60^{\circ} 43'.6$.

$$m = 162^{\circ} 39'.9, p = 120^{\circ} 48'.86, M = 160^{\circ} 1'.7.$$

$$N = \alpha - M = -19^{\circ} 18'.5.$$

:
$$b = 119^{\circ} 22'.5$$
, $ACD = 180^{\circ} - \gamma = 99^{\circ} 45'.1$, $n = -16^{\circ} 44'.8$,

giving n the negative sign since it is exterior to the triangle.

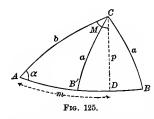

$$\therefore \gamma = 80^{\circ} 14'.9, \ \alpha = m + n = 145^{\circ} 55'.1.$$

2.
$$\alpha = 104^{\circ} 30'.7$$
, $\beta = 62^{\circ} 52'.1$, $c = 56^{\circ} 6'.4$.

..
$$M = 42^{\circ} 34'.8$$
; $N = 61^{\circ} 55'.9$; $m = 34^{\circ} 10'.2$; $p = 47^{\circ} 37'.5$; $b = 66^{\circ} 46'.0$; $\gamma = 53^{\circ} 30'.4$; $n = 54^{\circ} 10'.7$; $\alpha = 88^{\circ} 20'.9$.

3.
$$\alpha = 140^{\circ} 24'.6$$
, $\beta = 12^{\circ} 18'.6$, $c = 28^{\circ} 7'.7$.

...
$$M = 79^{\circ} 6'.4$$
; $N = 61^{\circ} 18'.2$; $m = 27^{\circ} 34'.7$; $p = 5^{\circ} 46'.1$; $b = 11^{\circ} 52'.9$; $\gamma = 29^{\circ} 13'.3$; $n = 10^{\circ} 24'.3$; $\alpha = 37^{\circ} 59'.0$,

164. Case V. Given a, b, a. — Let fall an arc of a great circle from the intersection of a and b, perpendicular to c. In this case there will be two solutions if a is intermediate in value between p and both $b \text{ and } 180^{\circ} - b \text{ (Art. } 120).$

In the triangle ACD, knowing band α , find m, M, and p by Napier's Then in the triangle DCB,

knowing p and a, find DB, DCB, and DBC. Then in the triangle ACB we have

$$c = AB = m + DB$$
, $\gamma = ACB = M + DCB$, $\beta = DBC$; and in the triangle ACB' ,

$$c' = AB' = m - DB$$
, $\gamma' = ACB' = M - DCB$, $\beta' = 180^{\circ} - DBC$.

1.
$$a = 148^{\circ} 34'.4$$
, $b = 142^{\circ} 11'.6$, $a = 153^{\circ} 17'.6$.

...
$$p = 164^{\circ} 0'.52$$
, and there are two solutions.

$$m = 34^{\circ} 43'.5$$
, $M = 68^{\circ} 19'.4$.

Also,
$$DB = 27^{\circ} \ 25'.1$$
, $DBC = 148^{\circ} \ 6'.3$, $DCB = 62^{\circ} \ 1'.8$.

...
$$c = 62^{\circ} 8'.6$$
, $\gamma = 130^{\circ} 21'.2$, $\beta = 148^{\circ} 6'.3$,

and
$$c' = 7^{\circ} 18'.4$$
, $\gamma' = 6^{\circ} 17'.6$, $\beta' = 31^{\circ} 53'.7$.

2.
$$a = 40^{\circ} 20'.4$$
, $b = 20^{\circ} 18'.2$, $a = 60^{\circ} 44'.4$.
 $p = 17^{\circ} 37'.3$; $m = 10^{\circ} 15'.0$; $M = 30^{\circ} 51'.2$; $\beta = 27^{\circ} 52'.9$; $DB = 36^{\circ} 53'.7$; $DCB = 68^{\circ} 2'.3$; $c = 47^{\circ} 8'.7$; $\gamma = 98^{\circ} 53'.5$.

3.
$$a = 98^{\circ} 16'$$
, $b = 74^{\circ} 38'$, $a = 78^{\circ} 40'$.
. $p = 70^{\circ} 59'.25$; $m = 35^{\circ} 34'.0$; $M = 37^{\circ} 6'.1$; $\beta = 72^{\circ} 49'.25$; $DB = 116^{\circ} 11'.4$; $DCB = 114^{\circ} 56'.4$; $c = 151^{\circ} 45'.4$; $\gamma = 152^{\circ} 2'.5$.

- 165. Case VI. Given α , β , α .—Pass to the polar triangle, in which we shall know a', b', and α' , and solve by the method of Art. 164. There may be two solutions of the polar triangle, and therefore of the triangle itself.
 - 1. $\alpha = 143^{\circ} \ 17'.4$, $\beta = 70^{\circ} \ 18'.4$, $\alpha = 160^{\circ} \ 40'.6$. . $\alpha' = 36^{\circ} \ 42'.6$, $b' = 109^{\circ} \ 41'.6$, $\alpha' = 19^{\circ} \ 19'.4$. . $p' = 18^{\circ} \ 9'.13$, and there will be two solutions. $M' = 96^{\circ} \ 44'.3$, $m' = 110^{\circ} \ 46'.3$.

Also $D'B' = 32^{\circ} 28'.25$, $D'C'B' = 63^{\circ} 54'.9$, $D'B'C' = 31^{\circ} 24'.7$ $c_1' = 143^{\circ} 14'.55$, $\gamma_1' = 160^{\circ} 39'.2$, $\beta_1' = 31^{\circ} 24'.7$,

and $c_1{''}=78^\circ~18'.05,~\gamma_1{''}=32^\circ~49'.4,~\beta_1{''}=148^\circ~35'.3.$ Taking the supplements to obtain the elements of the original triangle,

 $\gamma = 36^{\circ} 45'.45, c = 19^{\circ} 20'.8, b = 148^{\circ} 35'.3,$

and $\gamma' = 101^{\circ} 41'.95$, $c' = 147^{\circ} 10'.6$, $b' = 31^{\circ} 24'.7$.

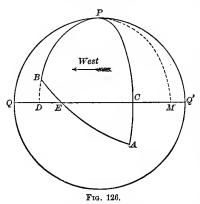

- 2. $\alpha = 117^{\circ} 54'.4$, $\beta = 45^{\circ} 8'.6$, $\alpha = 76^{\circ} 37'.5$. $p' = 136^{\circ} 23'.8$; $M' = 18^{\circ} 37'.7$; $m' = 13^{\circ} 5'.3$; $D'C'B' = 120^{\circ} 17'.5$; $D'B'C' = 128^{\circ} 42'.1$; $D'B' = 130^{\circ} 15'.9$; $\gamma' = 138^{\circ} 55'.2$; $c' = 143^{\circ} 21'.2$; $\therefore b = 51^{\circ} 17'.9$; $c = 41^{\circ} 4'.8$; $\gamma = 36^{\circ} 38'.8$.
- 3. $\alpha = 104^{\circ} \ 40'.0$, $\beta = 80^{\circ} \ 13'.6$, $\alpha = 126^{\circ} \ 50'.4$. $\therefore p' = 52^{\circ} \ 3'.8$; $M' = 102^{\circ} \ 46'.0$; $m' = 106^{\circ} \ 1'.7$; $D'C'B' = 70^{\circ} \ 22'.9$; $D'B'C' = 54^{\circ} \ 36'.8$; $D'B' = 65^{\circ} \ 40'.7$; $\gamma_{1}' = 172^{\circ} \ 8'.9$; $\gamma_{1}'' = 32^{\circ} \ 23'.1$; $c_{1}' = 171^{\circ} \ 42'.4$; $c_{1}'' = 40^{\circ} \ 21'.0$; $\beta_{1}' = 54^{\circ} \ 36'.8$; $\beta_{1}'' = 125^{\circ} \ 23'.2$; $\therefore c = 7^{\circ} \ 51'.1$; $\gamma = 8^{\circ} \ 17'.6$; $b = 125^{\circ} \ 23'.2$; $c' = 147^{\circ} \ 36'.9$; $\gamma' = 139^{\circ} \ 39'.0$; $b' = 54^{\circ} \ 36'.8$.

and

CHAPTER XII.

APPLICATIONS OF SPHERICAL TRIGONOMETRY.

166. To find the Shortest Distance between Two Points on the Surface of the Earth,* the earth being treated as a sphere. — North latitudes and west longitudes are considered positive. Let QQ' be the equator, P the north pole, A and B the two

points, and PM the meridian from which the longitudes are measured. The longitude of A is MPC and that of B is MPD, both being positive since they are measured westward. The latitudes are CA and DB, the former being negative since it is measured southward.

In the triangle APB the sides AP and BP are found by algebraically subtracting

the latitudes from 90°, and the angle APB is the algebraic difference of the longitudes. Hence we know two sides and their included angle, so that we can solve the triangle, using the method of Art. 151 when the distance only is required, and that of Art. 150 when we wish to find all the elements.

- Find the shortest distance between New York, 40° 45'.4 N., 73° 58'.4 W., and Rio Janeiro, 22° 54'.4 S., 43° 10'.4 W.
 - .. $BP=49^{\circ} 14'.6$, $AP=112^{\circ} 54'.4$, $APB=30^{\circ} 48'.0$. Ans. $AB=69^{\circ} 48'.2$.
- 2. Find the shortest distance between New York, 40° 45'.4 N., 73° 58'.4 W., and Paris, 48° 50'.2 N., 2° 20'.2 E. Ans. $AB = 52^{\circ}$ 26'.8.
- * The shortest distance between two points on a sphere is the arc of the great circle passing through the points.

If the bearings of the great circle AB at A and B are required, it will be necessary to find the angles PAB and PBA.

3. A ship sailed from Calcutta, 22° 34'.8 N., 88° 27'.3 E., on an arc of a great circle to Melbourne, 37° 48'.0 S., 144° 58'.0 E. Find the distance sailed and the hearings * at both points.

Ans. At Calcutta, S. 41° 56'.61 E.; at Melbourne, S. 51° 21'.47 E.; distance, 80° 22'.4 or 80° 22'.6.

4. A ship sailed from the Cape of Good Hope, 34° 22' S., 18° 29' E., on an arc of a great circle to Cape St. Roque, 5° 28' S., 35° 16' W. Find the distance sailed and the bearings * at both points.

Ans. At G. H., N. 72° 28'.0 W.; at S. R., N. 52° 15'.0 W.; distance, 57° 20'.4.

5. A ship sailed from Bombay, 18° 56' N., 72° 53' E., on an arc of a great circle to the Cape of Good Hope, 34° 22' S., 18° 29' E. Find the distance sailed and the hearings * at both points.

Ans. At Bombay, S. 44° 12'.8 W.; at G. H., S. 53° 2'.6 W.; distance, 74° 15′.2 or 74° 15′.4.

6. A ship sailed from Bombay, 18° 56' N., 72° 53' E., on an arc of a great circle for the Cape of Good Hope, 34° 22' S., 18° 29' E. Find the distance to the equator and the bearing* and longitude at the equator. [Use the triangle BDE; the angle $PBA = 135^{\circ} 47'.2$ was found in Ex. 5.]

Ans. S. 41° 16'.1 W.; distance, 25° 34'.5; longitude, 55° 21'.8 E.

7. From a point whose latitude is 17° N. and longitude 130° W. a ship sailed an arc of a great circle over a distance of 4150 miles, starting S. 54° 20' W. Find its latitude and longitude if the length of 1° is $69\frac{1}{6}$ miles.

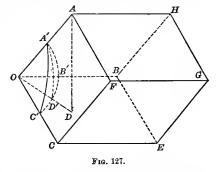

Ans. Lat., 19° 40'.52 or 19° 40'.60 S.; Long., 178° 20'.9 W.

167. Given the Lengths of the Three Edges of a Parallelopiped that meet in a Point, and the Angles between them, to find the Surface and the Volume of the Parallelopiped. - Let OG be the solid, AD the perpendicular from A to BOC, and

hence AOD a plane perpendicular to BOC. Let the angles and edges be

$$BOC = a$$
, $AOC = b$,
 $AOB = c$, $OA = l$,
 $OB = m$, $OC = n$.

Describe a sphere with a radius of unity about O as a center, its intersections with

the planes forming the figure marked by the primed letters.

^{*} The course of the ship.

Then the surface is

$$S = 2 OBEC + 2 OAFC + 2 OBHA$$

= 2 (mn sin a + ln sin b + lm sin c). (1)

In the triangle A'D'B', right-angled at D', we have

$$\sin D'A' = \sin B'A' \sin A'B'D';$$

$$\therefore \sin D'A' = \sin c \sin A'B'D'.$$

But in the triangle A'B'C' we know the three sides a, b, c; hence

$$\sin A'B'D' = 2\sin\frac{1}{2}A'B'D'\cos\frac{1}{2}A'B'D'$$

$$= \frac{2}{\sin a \sin c} \sqrt{\sin s \sin (s-a)\sin (s-b)\sin (s-c)}.$$

 $\therefore \sin D'A' = \sin DOA$

$$= \frac{2}{\sin a} \sqrt{\sin s \sin (s-a) \sin (s-b) \sin (s-c)}.$$

 $\therefore DA = OA \sin DOA$

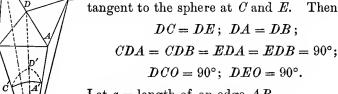

$$= \frac{2 l}{\sin a} \sqrt{\sin s \sin (s-a) \sin (s-b) \sin (s-c)}.$$

Hence the volume is

$$V = OBEC \times DA$$

$$= 2 \operatorname{lmn} \sqrt{\sin s \sin (s-a) \sin (s-b) \sin (s-c)}. \tag{2}$$

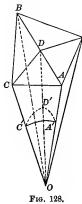

168. To find the Volume of a Regular Polyhedron. — Let AB be the edge in which two adjacent faces intersect, D its middle point, C and E the centers of the polygonal faces, and O the center of the sphere inscribed in the polyhedron, the faces being

Let a = length of an edge AB,

s = number of sides of each polygonalface.

n = number of faces meeting at a vertexof the polyhedron,

N = number of faces of the polyhedron, E = edge angle CDE of the polyhedron.

Then $CD = AD \cot ACD = \frac{1}{2} a \cot \frac{180^{\circ}}{s}$. $CO = CD \tan CDO = CD \tan \frac{1}{2} E$.

...
$$CO = \frac{1}{2} a \cot \frac{180^{\circ}}{s} \tan \frac{1}{2} E.$$
 (1)

About O as a center, with a unit radius, describe a sphere, and let its intersections with the three planes form the triangle A'C'D'. Then

$$A'C'D' = ACD = \frac{180^{\circ}}{8}; \ A'D'C' = 90^{\circ}; \ C'A'D' = \frac{1}{2} \frac{360^{\circ}}{n}$$

By Napier's rules,

$$\cos C'A'D' = \cos C'D' \sin A'C'D',$$

or

$$\cos\frac{180^{\circ}}{n} = \cos C' D' \sin\frac{180^{\circ}}{s}.$$

But

 $\cos C'D' = \cos COD = \cos (90^{\circ} - CDO) = \sin CDO = \sin \frac{1}{2}E.$

$$\therefore \cos \frac{180^{\circ}}{n} = \sin \frac{1}{2} E \sin \frac{180^{\circ}}{s}$$

$$\therefore \sin \frac{1}{2} E = \cos \frac{180^{\circ}}{n} \csc \frac{180^{\circ}}{s} \tag{2}$$

Then, if A is the area of a face, the volume is

$$V = \frac{1}{3} CO \times A \times N = \frac{1}{24} Nsa^3 \cot^2 \frac{180^\circ}{s} \tan \frac{1}{2} E.$$
 (3)

Find $\frac{1}{2}E$ from (2) and then V from (3).

1. Dodecahedron, formed by 12 regular pentagons, 3 meeting at a vertex.

1. Dodecane from, formed by 12 reginar pentagor s = 5, n = 3, N = 12. $\log \cos 60^{\circ} = 9.69897$ $\log \csc 36^{\circ} = 0.23078$ $\log \sin \frac{1}{2} E = 9.92975$

 $\log \frac{Ns}{24} = 0.39794$ $\log \cot^2 36^\circ = 0.27748$ $\log \tan \frac{1}{3} E = 0.20896$

 $\frac{2E}{0.88438}$

0.88438... $V = 7.663 a^3$.

2. Tetrahedron, formed by 4 equilateral triangles, 3 meeting at a vertex.

$$s = 3, n = 3, N = 4.$$
 Ans. $V = 0.1179 a^3.$

3. Cube, formed by 6 squares, 3 meeting at a vertex.

...
$$s = 4$$
, $n = 3$, $N = 6$. Ans. $V = a^3$. Chock. Trig.—12

4. Octahedron, formed by 8 equilateral triangles, 4 meeting at a vertex.

$$s = 3, n = 4, N = 8.$$
 Ans. $V = 0.4714 a^3.$

5. Icosahedron, formed by 20 equilateral triangles, 5 meeting at a vertex. s = 3, n = 5, N = 20. Ans. $V = 2.182 a^3.$

Great Circles are drawn to the Vertices,

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$$
.

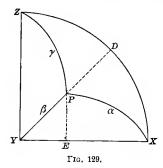

where α , β , and γ are the arcs. — In Fig. 129, produce YP and ZP to D and E. In the right triangle PDX,

 $\sin PD = \sin \alpha \sin PXD$; $\therefore \cos \beta = \sin \alpha \sin PXD$. (1) In the right triangle PEX,

 $\sin PE = \sin \alpha \sin PXE$; $\therefore \cos \gamma = \sin \alpha \cos PXD$. (2) Squaring (1) and (2), and adding, we have

$$\cos^2\beta + \cos^2\gamma = \sin^2\alpha.$$

$$\therefore \cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1.$$
 Q.E.D.

170. If from Any Two Points P and P' in a Trirectangular Triangle Arcs of Great Circles are drawn to the Three Vertices, and if v is the Length of the Arc PP', prove that

 $\cos v = \cos \alpha \cos \alpha' + \cos \beta \cos \beta' + \cos \gamma \cos \gamma'$

In the triangle PYP' (Fig. 130),

$$\cos v = \cos \beta \cos \beta' + \sin \beta \sin \beta' \cos P Y P'. \tag{1}$$

But

$$\cos P Y P' = \cos (Z Y P' - Z Y P).$$

$$\therefore \cos PYP' = \cos ZYP' \cos ZYP + \sin ZYP' \sin ZYP. \quad (2)$$

In
$$ZYP$$
, $\cos \gamma = \sin \beta \cos ZYP$.*

In ZYP' , $\cos \gamma' = \sin \beta' \cos ZYP'$.*

In XYP , $\cos \alpha = \sin \beta \cos XYP * = \sin \beta \sin ZYP$.

In XYP' , $\cos \alpha' = \sin \beta' \cos XYP' * = \sin \beta' \sin ZYP'$.

Substituting in (1) the values found from (2) and (3),

$$\cos v = \cos \beta \cos \beta' + \cos \gamma \cos \gamma' + \cos \alpha \cos \alpha'$$
. Q.E.D.

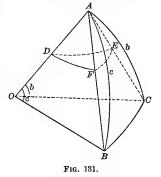

This is the formula for the cosine of the angle between two lines in space, the angles made by them with three lines at right angles to each other being α , β , γ , and α' , β' , γ' , respectively.

171. To find the Angle a' between the Chords of Two Sides of a Spherical Triangle, having given the Two Sides b and c, and the Angle a between them. —Let AB = c, AC = b, the spherical

angle $BAC = \alpha$, and the plane angle $BAC = \alpha'$, O being the center of the sphere. About A as a center describe a sphere, and let its intersections with the planes OAB, OAC, and BAC form the triangle DEF. Then

$$DF = OAB = 90^{\circ} - \frac{1}{2}c;$$

 $DE = OAC = 90^{\circ} - \frac{1}{2}b;$
 $FDE = \alpha; FE = BAC = \alpha'.$

$$\therefore \cos FE = \cos DE \cos DF + \sin DE \sin DF \cos FDE.$$

$$\therefore \cos \alpha' = \sin \frac{1}{2}b \sin \frac{1}{2}c + \cos \frac{1}{2}b \cos \frac{1}{2}c \cos \alpha. \tag{1}$$

This formula is true for all values of b, c, and α . When b and c are small, the *correction* that must be applied to α to obtain α' may be found from (1) as follows:

Let
$$p = b + c$$
, and $q = b - c$. Then, from Art. 72,
 $\cos \alpha' = \frac{1}{2} \cos \frac{1}{2} q - \frac{1}{2} \cos \frac{1}{2} p + \frac{1}{2} (\cos \frac{1}{2} p + \cos \frac{1}{2} q) \cos \alpha$
 $= -\sin^2 \frac{1}{4} q + \sin^2 \frac{1}{4} p + (1 - \sin^2 \frac{1}{4} p - \sin^2 \frac{1}{4} q) \cos \alpha$
 $= (\sin^2 \frac{1}{4} p - \sin^2 \frac{1}{4} q) (\sin^2 \frac{1}{2} \alpha + \cos^2 \frac{1}{2} \alpha) + \cos \alpha$
 $- (\sin^2 \frac{1}{4} p + \sin^2 \frac{1}{4} q) (\cos^2 \frac{1}{2} \alpha - \sin^2 \frac{1}{2} \alpha)$.
 $\therefore \cos \alpha' = \cos \alpha - 2 \sin^2 \frac{1}{4} q \cos^2 \frac{1}{2} \alpha + 2 \sin^2 \frac{1}{2} n \sin^2 \frac{1}{2} \alpha$. (2)

* Eq. (2), Art. 121.

Let $\alpha' = \alpha + \theta$, where θ is so small that we may place

$$\sin \theta = \theta$$
, and $\cos \theta = 1$.
 $\therefore \cos \alpha' = \cos \alpha \cos \theta - \sin \alpha \sin \theta$.
 $\therefore \cos \alpha' = \cos \alpha - \theta \sin \alpha$. (3)

Comparing (2) and (3),

$$2 \theta \sin \frac{1}{2} \alpha \cos \frac{1}{2} \alpha = 2 \sin^2 \frac{1}{4} q \cos^2 \frac{1}{2} \alpha - 2 \sin^2 \frac{1}{4} p \sin^2 \frac{1}{2} \alpha.$$

$$\therefore \theta = \sin^2 \frac{1}{4} q \cot \frac{1}{2} \alpha - \sin^2 \frac{1}{4} p \tan \frac{1}{2} \alpha.$$

$$\therefore \theta'' = \frac{1}{\sin 1''} \sin^2 \frac{1}{4} q \cot \frac{1}{2} \alpha - \frac{1}{\sin 1''} \sin^2 \frac{1}{4} p \tan \frac{1}{2} \alpha, \tag{4}$$

since $\theta = \theta'' \sin 1''$ (Art. 81).

172. The Angles of Elevation of Two Points, in the Directions OA and OB, above a Horizontal Plane, and the Inclined Angle AOB, were measured with a Sextant. Find the Hori-

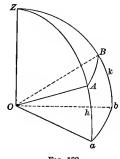

Fig. 132.

zontal Angle between the Points, as seen from O.—Let OZ be the vertical line, Oabthe horizontal plane; aOA = h, and bOB = kthe measured altitudes; and AOB = c the inclined angle. Describe a sphere about O as a center. Then in the triangle AZB,

 $AZ = 90^{\circ} - h$, $BZ = 90^{\circ} - k$, AB = c, and hence the required angle a O b = AZBmay be computed, since we know the three sides of the triangle.

When h and k are small, the correction to be applied to the measured value c to obtain a Ob may be found as follows:*

From (2), Art. 121,

$$\cos AZB = \frac{\cos c - \sin h \sin k}{\cos h \cos k} = \frac{\cos c - hk}{(1 - \frac{1}{2}h^2)(1 - \frac{1}{2}k^2)}$$
(Art. 78)
$$= \frac{\cos c - hk}{1 - \frac{1}{2}(h^2 + k^2)} = (\cos c - hk)[1 + \frac{1}{2}(h^2 + k^2)].$$

$$\therefore \cos AZB = \cos c + \frac{1}{2}(h^2 + k^2)\cos c - hk.$$
(1)

^{*} Neglecting powers of h and k above the second.

Let θ be the correction to c so that $AZB = c + \theta$.

$$\therefore \cos AZB = \cos c \cos \theta - \sin c \sin \theta.$$

$$\therefore \cos AZB = \cos c - \theta \sin c.$$
(2)

Comparing (1) and (2),

$$\theta = -\frac{(h^2 + k^2)(\cos^2\frac{1}{2}c - \sin^2\frac{1}{2}c) - 2\,hk\,(\cos^2\frac{1}{2}c + \sin^2\frac{1}{2}c)}{4\sin\frac{1}{2}c\cos\frac{1}{2}c}.$$

$$\therefore \ \theta = \frac{1}{4} (h+k)^2 \tan \frac{1}{2} c - \frac{1}{4} (h-k)^2 \cot \frac{1}{2} c, \tag{3}$$

where θ , h, and k are expressed in circular measure. To find θ in seconds, let $\theta = \theta'' \sin 1''$, $h = h'' \sin 1''$, $k = k'' \sin 1''$.

$$\therefore \theta'' = \frac{1}{4} (h'' + k'')^2 \sin 1'' \tan \frac{1}{2} c - \frac{1}{4} (h'' - k'')^2 \sin 1'' \cot \frac{1}{2} c. \quad (4)$$

SPHERICAL EXCESS.

173. Area of a Spherical Triangle. — From geometry we know that the areas of any two triangles are to each other as their spherical excesses, the spherical excess being the amount by which the sum of the three angles exceeds 180° . We also know that the area of the trirectangular triangle is $\frac{1}{2}\pi r^2$, and that its spherical excess is 90° . If A is the area of any triangle, and E its spherical excess expressed in degrees, we have

$$A: \frac{1}{2}\pi r^2 = E: 90^{\circ}. \tag{1}$$

$$\therefore A = E \frac{\pi r^2}{180^\circ},\tag{2}$$

and

$$E = A \frac{180^{\circ}}{\pi r^2}$$
 (3)

174. Lhuillier's Theorem. — We have

$$\tan \frac{1}{4}E = \frac{\sin \frac{1}{4}(\alpha + \beta + \gamma - \pi)}{\cos \frac{1}{4}(\alpha + \beta + \gamma - \pi)} \cdot \frac{2\cos \frac{1}{4}(\alpha + \beta + \pi - \gamma)}{2\cos \frac{1}{4}(\alpha + \beta + \pi - \gamma)}$$
$$= \frac{\sin \frac{1}{2}(\alpha + \beta) - \sin \frac{1}{2}(\pi - \gamma)}{\cos \frac{1}{2}(\alpha + \beta) + \cos \frac{1}{2}(\pi - \gamma)},$$

from (6) and (7), Art. 72.

$$\therefore \tan \frac{1}{4}E = \frac{\sin \frac{1}{2}(\alpha + \beta) - \cos \frac{1}{2}\gamma}{\cos \frac{1}{2}(\alpha + \beta) + \sin \frac{1}{2}\gamma}.$$

Hence, from (1) and (2), Art. 145, substituting for $\sin \frac{1}{2}(\alpha + \beta)$ and $\cos \frac{1}{2}(\alpha + \beta)$, we have

$$\tan \frac{1}{4} E = \frac{\cos \frac{1}{2} (a - b) - \cos \frac{1}{2} c}{\cos \frac{1}{2} (a + b) + \cos \frac{1}{2} c} \cdot \frac{\cos \frac{1}{2} \gamma}{\sin \frac{1}{2} \gamma}$$

$$= \frac{\sin \frac{1}{4} (a - b + c) \sin \frac{1}{4} (b + c - a)}{\cos \frac{1}{4} (a + b + c) \cos \frac{1}{4} (a + b - c)} \cot \frac{1}{2} \gamma,$$

from (4) and (3), Art. 73.

$$\therefore \tan \frac{1}{4}E = \frac{\sin \frac{1}{2}(s-b)\sin \frac{1}{2}(s-a)}{\cos \frac{1}{2}s\cos \frac{1}{2}(s-c)} \sqrt{\frac{\sin s \sin (s-c)}{\sin (s-a)\sin (s-b)}} \\
= \sqrt{\left[\frac{\sin^2 \frac{1}{2}(s-b)\sin^2 \frac{1}{2}(s-a)}{\cos^2 \frac{1}{2}s\cos^2 \frac{1}{2}(s-c)} \times \frac{\sin \frac{1}{2}s\cos \frac{1}{2}s\sin \frac{1}{2}(s-c)\cos \frac{1}{2}(s-c)}{\sin \frac{1}{2}(s-a)\cos \frac{1}{2}(s-a)\sin \frac{1}{2}(s-b)\cos \frac{1}{2}(s-b)}\right]}.$$

$$\tan \frac{1}{4} E = \sqrt{\tan \frac{1}{2} s \tan \frac{1}{2} (s-a) \tan \frac{1}{2} (s-b) \tan \frac{1}{2} (s-c)}. \text{ Q.E.i.}$$

175. Spherical Excess in Terms of Two Sides and their lacluded Angle.

$$\tan \frac{1}{2}E = \frac{\sin \frac{1}{2}(\alpha + \beta + \gamma - \pi)}{\cos \frac{1}{2}(\alpha + \beta + \gamma - \pi)} = \frac{-\cos \frac{1}{2}(\alpha + \beta + \gamma)}{\sin \frac{1}{2}(\alpha + \beta + \gamma)}$$
$$= \frac{\sin \frac{1}{2}(\alpha + \beta)\sin \frac{1}{2}\gamma - \cos \frac{1}{2}(\alpha + \beta)\cos \frac{1}{2}\gamma}{\sin \frac{1}{2}(\alpha + \beta)\cos \frac{1}{2}\gamma + \cos \frac{1}{2}(\alpha + \beta)\sin \frac{1}{2}\gamma}.$$

Substituting for $\sin \frac{1}{2}(\alpha + \beta)$ and $\cos \frac{1}{2}(\alpha + \beta)$ from (1) and (2), Art. 145,

$$\tan \frac{1}{2} E = \frac{\sin \frac{1}{2} \gamma \cos \frac{1}{2} \gamma \left[\cos \frac{1}{2} (a-b) - \cos \frac{1}{2} (a+b)\right]}{\cos \frac{1}{2} (a-b) \cos^{2} \frac{1}{2} \gamma + \cos \frac{1}{2} (a+b) \sin^{2} \frac{1}{2} \gamma}$$

$$= \frac{\sin \frac{1}{2} \gamma \cos \frac{1}{2} \gamma \left[+2 \sin \frac{1}{2} a \sin \frac{1}{3} b\right]}{\frac{1}{2} \left[\cos \frac{1}{2} (a-b) + \cos \frac{1}{2} (a+b)\right] + \frac{1}{2} \left[\cos \frac{1}{2} (a-b) - \cos \frac{1}{2} (a+b)\right] \cos \gamma}$$

$$= \frac{\sin \frac{1}{2} a \sin \frac{1}{2} b \sin \gamma}{\cos \frac{1}{2} a \cos \frac{1}{2} b + \sin \frac{1}{2} a \sin \frac{1}{2} b \cos \gamma}.$$

$$\therefore \tan \frac{1}{2} E = \frac{\tan \frac{1}{2} a \tan \frac{1}{2} b \sin \gamma}{1 + \tan \frac{1}{3} a \tan \frac{1}{3} b \cos \gamma}.$$
Q.E.I.

176. Approximate Value of the Spherical Excess, neglecting Powers above the Second. — Let the sides of the triangle be so

small that the powers of their circular measures higher than the second may be neglected. We have, from Art. 78,

$$\tan x = x + \frac{1}{3}x^3 + \dots, \tag{1}$$

where x is expressed in circular measure.

Let the lengths of the sides be a, b, and c when expressed in circular measure, and a', b', and c' in linear measure, r being the radius of the sphere. Then

$$a = \frac{a'}{r}, \quad b = \frac{b'}{r}, \quad c = \frac{c'}{r}.$$
 (2)

Placing these values of a, b, and c for x in (1), and substituting in Lhuillier's theorem, we have, neglecting powers above the second,

$$\tan \frac{1}{4}E = \sqrt{\frac{s'}{2r} \cdot \frac{s'-a'}{2r} \cdot \frac{s'-b'}{2r} \cdot \frac{s'-c'}{2r}},\tag{3}$$

where

$$s' = \frac{1}{2}(a' + b' + c'). \tag{4}$$

$$\therefore \tan \frac{1}{4} E = \frac{1}{4 r^2} \sqrt{s'(s' - a')(s' - b')(s' - c')}.$$
 (5)

Since $\frac{1}{4}E$ is small, we place its tangent equal to its arc.

$$\therefore \frac{1}{4}E = \frac{1}{4r^2}\sqrt{s'(s'-a')(s'-b')(s'-c')}$$
 (6)

or

$$E = \frac{1}{r^2}A,\tag{7}$$

where A is the area of the plane triangle whose sides are a', b', and c', E being expressed in circular measure.

To find the value of E in seconds of arc, divide both sides by $\sin 1''$.

 $\therefore \frac{E}{\sin 1''} = E'' = \frac{A}{r^2 \sin 1''} \tag{8}$

Hence, whenever the third powers of the circular measures of the sides can be neglected, the spherical excess is found by computing the area of the triangle, considering it as a plane triangle, and dividing the area by $r^2 \sin 1''$.

177. Approximate Value of the Spherical Excess, neglecting Powers above the Fourth. — From Lhuillier's theorem,

$$\tan^{2}\frac{1}{4}E = \left[\frac{s'}{2r} + \frac{s'^{3}}{24 r^{3}}\right] \left[\frac{s' - a'}{2r} + \frac{(s' - a')^{3}}{24 r^{3}}\right]$$

$$= \left[\frac{s' - b'}{2r} + \frac{(s' - b')^{3}}{24 r^{3}}\right] \left[\frac{s' - c'}{2r} + \frac{(s' - c')^{3}}{24 r^{3}}\right]$$

$$= \frac{A^{2}}{16 r^{4}} + \frac{A^{2}}{192 r^{6}} \left[(s' - c')^{2} + (s' - b')^{2} + (s' - a')^{2} + s'^{2}\right],$$
where
$$A^{2} = s'(s' - a')(s' - b')(s' - c').$$

$$\therefore \tan^{2}\frac{1}{4}E = \frac{A^{2}}{16 r^{4}} + \frac{A^{2}}{192 r^{6}} (a'^{2} + b'^{2} + c'^{2}).$$

$$\therefore \tan^{2}\frac{1}{4}E = \frac{A}{4 r^{2}} \left(1 + \frac{a'^{2} + b'^{2} + c'^{2}}{12 r^{2}}\right)^{\frac{1}{2}}$$

$$= \frac{A}{4 r^{2}} \left(1 + \frac{a'^{2} + b'^{2} + c'^{2}}{24 r^{2}}\right).$$

$$\therefore E'' = \frac{A}{r^{2} \sin 1''} \left(1 + \frac{a'^{2} + b'^{2} + c'^{2}}{24 r^{2}}\right).$$
Q.E.I.

This value exceeds that found in Art. 176 by

$$\frac{A}{r^2 \sin 1''} \cdot \frac{a'^2 + b'^2 + c'^2}{24 \, r^2}$$

If a' = b' = c' = 100 miles, and r = 3963.3 miles, we obtain

$$\frac{A}{r^2 \sin 1''} = 56''.863$$
; $\frac{a'^2 + b'^2 + c'^2}{24 r^2} = 0.00008$;

so that the correction to the value of E'' given by (8), Art. 176, is only

$$56''.863 \times 0.00008 = 0''.005$$
.

178. Legendre's Theorem. — If the sides of a spherical triangle are very small compared with the radius of the sphere, the angles of the plane triangle whose sides are of the same length as

those of the spherical triangle, are equal to the corresponding angles of the spherical triangle diminished by one third of the spherical excess. — Let a', b', and c' be the lengths of the sides of the spherical triangle expressed in linear measure, and a, b, and c the lengths in circular measure.

$$\therefore a = \frac{a'}{r}, \quad b = \frac{b'}{r}, \quad c = \frac{c'}{r}. \tag{1}$$

Let α be an angle of the spherical triangle and α' the corresponding angle of the plane triangle. We have

$$\cos \alpha = \frac{\cos \alpha - \cos b \cos c}{\sin b \sin c}.$$
 (2)

From Art. 78,

$$\cos a = 1 - \frac{1}{2}a^2 + \frac{1}{24}a^4 - \dots \qquad \sin b = b - \frac{1}{6}b^3 + \dots \\ \cos b = 1 - \frac{1}{2}b^2 + \frac{1}{24}b^4 - \dots \qquad \sin c = c - \frac{1}{6}c^3 + \dots \\ \cos c = 1 - \frac{1}{2}c^2 + \frac{1}{24}c^4 - \dots$$

$$\therefore \cos \alpha = \frac{\frac{1}{2} (b^2 + c^2 - a^2) + \frac{1}{24} (a^4 - b^4 - c^4 - 6b^2c^2)}{bc \left[1 - \frac{1}{6} (b^2 + c^2)\right]}, (3)$$

the terms of orders higher than the fourth being neglected.

$$\therefore \cos \alpha = \frac{1}{2bc} \left[(b^2 + c^2 - a^2) + \frac{1}{12} (a^4 - b^4 - c^4 - 6b^2c^2) \right] \left[1 - \frac{1}{6} (b^2 + c^2) \right]^{-1} \\
= \frac{1}{2bc} \left[(b^2 + c^2 - a^2) + \frac{1}{12} (a^4 - b^4 - c^4 - 6b^2c^2) \right] \left[1 + \frac{1}{6} (b^2 + c^2) + \cdots \right].$$

$$\therefore \cos \alpha = \frac{b^2 + c^2 - a^2}{2bc} + \frac{a^4 + b^4 + c^4 - 2a^2b^2 - 2a^2c^2 - 2b^2c^2}{24bc}, \tag{4}$$

the terms of orders higher than the fourth being neglected, as before.

In the plane triangle,

$$\cos \alpha' = \frac{b'^2 + c'^2 - a'^2}{2b'c'} = \frac{b^2 + c^2 - a^2}{2bc},\tag{5}$$

from (1)

$$\therefore \cos \alpha = \cos \alpha' + \frac{a^4 + b^4 + c^4 - 2a^2b^2 - 2a^2c^2 - 2b^2c^2}{24bc}.$$
 (6)

$$\therefore \cos \alpha = \cos \alpha' + \frac{1}{r^2} \cdot \frac{a'^4 + b'^4 + c'^4 - 2 a'^2 b'^2 - 2 a'^2 c'^2 - 2 b'^2 c'^2}{24 b' c'}$$

(7)

Let $s' = \frac{1}{2}(a' + b' + c')$; then

$$s'(s'-a')(s'-b')(s'-c')$$

$$= -\frac{1}{16}(a'^4+b'^4+c'^4-2a'^2b'^2-2a'^2c'^2-2b'^2c'^2). \quad (8)$$

But the area of the plane triangle is

$$\sqrt{s'(s'-a')(s'-b')(s'-c')} = \frac{1}{2}b'c'\sin\alpha'.$$
 (9)

Hence (7) becomes, from (8) and (9),

$$\cos \alpha = \cos \alpha' - \frac{1}{6 r^2} b'c' \sin^2 \alpha'. \tag{10}$$

Let
$$\alpha = \alpha' + \theta$$
. (11)

$$\therefore \cos \alpha = \cos \alpha' \cos \theta - \sin \alpha' \sin \theta. \tag{12}$$

Since θ is small, we may place $\cos \theta = 1$, and $\sin \theta = \theta$.

$$\therefore \cos \alpha = \cos \alpha' - \theta \sin \alpha'. \tag{13}$$

Comparing (10) and (13),

$$\theta = \frac{1}{6r^2}b'c'\sin\alpha' = \frac{1}{3}\cdot\frac{1}{2}\cdot\frac{b'c'\sin\alpha'}{r^2}.$$
 (14)

Hence, from (7), Art. 176,

$$\theta = \frac{1}{3} E,$$

$$\alpha' = \alpha - \frac{1}{2} E.$$

Q.E.D.

and, from (11),

179. Application of Legendre's Theorem. — In the New York State Survey the angles of the spherical triangle, whose vertices were at Howlett, Gilbertsville, and Eagle, were measured, the distance from Howlett to Gilbertsville having been already computed. The measured values were

At Howlett,
$$\alpha = 85^{\circ} 18' 57''.71$$
 $\log b = 4.54227 32$
At Eagle, $\beta = 51^{\circ} 35' 41''.61$ $\log r = 6.80459 32$
At Gilbertsville, $\gamma = 43^{\circ} 5' 24''.24$
 $\therefore \alpha + \beta + \gamma = 180^{\circ} 0' 3''.56$

The formula for the spherical excess is (Art. 176)

$$E'' = \frac{A}{r^2 \sin 1''} = \frac{1}{2} \cdot \frac{b^2 \sin \alpha \sin \gamma}{\sin \beta} \cdot \frac{1}{r^2 \sin 1''}$$

$$\log b^2 = 9.08455$$

$$\operatorname{colog} 2 = 9.69897 - 10$$

$$\operatorname{log} \sin \alpha = 9.99855 - 10$$

$$\operatorname{log} \sin \gamma = 9.83451 - 10$$

$$\operatorname{col} \sin \beta = 0.10588$$

$$\operatorname{colog} r^2 = 6.39081 - 20$$

$$\operatorname{col} \sin 1'' = 5.31443$$

$$\operatorname{log} E'' = 0.42770$$

$$\therefore \underline{1}_3 E'' = 0''.8924.$$

The errors due to observation therefore amounted to 3''.56 - 2''.677 = 0''.883. This discrepancy was distributed among the three angles according to the method of least squares,* giving the following results:

	OBSERVED ANGLES.	Coreection.	Spherical Angles.	$\frac{1}{3}E''$.	PLANE ANGLES.
$\alpha = 85^{\circ} 18'$	57".71	- 0".747	56".963	0".893	$56^{\prime\prime}.070=\alpha^{\prime}$
$\beta = 51^{\circ}35'$	41".61	+1''.355	42".965	0".892	$42''.073 = \beta'$
$\gamma = 43^{\circ} 5'$	24".24	- 1".491	22''.749	0".892	$21''.857 = \gamma'$
Sum = 180° 0′	311.56	0".883	2".677	2".677	0".000

Using the plane triangle, we find by the sine proportion:

$$\begin{array}{lll} \log b' = 4.542\ 2732 & \log b' = 4.542\ 2732 \\ \cosh \beta' = 0.105\ 8837 & \cosh \beta' = 0.105\ 8837 \\ \log \sin \alpha' = \frac{9.998\ 5468-10}{4.646\ 7037} & \log \sin \gamma' = \frac{9.834\ 5089-10}{4.482\ 6658} \\ \alpha' = 44330.61\ \text{meters.} & c' = 30385.46\ \text{meters.} \end{array}$$

These are the distances between the points measured on the great circles joining them.

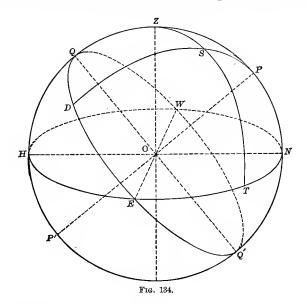

ASTRONOMICAL APPLICATIONS.

180. Definitions. — Let us consider the earth as a point O (Fig. 134), and let a sphere be described about O as a center, with a radius indefinitely great, so that all the stars shall be within the sphere. The figure represents the sphere as seen from the outside.

^{*} Eleven angles were involved in the adjustment.

The zenith Z is the point where a vertical line — the plumb line — pierces the sphere.

The horizon HWNE is the great circle cut from the sphere by a plane through O perpendicular to the plumb line. N, E, H, and W are the north, east, south, and west points of the horizon.

Vertical circles are great circles whose planes pass through the plumb line OZ, as ZST in the plane OZT.

The meridian HZN is the vertical circle passing through the north and south points of the horizon.

The altitude TS of a star or point is its angular distance above the horizon, measured on a vertical circle.

The zenith distance ZS is the complement of the altitude.

The azimuth of a star or point is the arc NT or the angle NZT between the meridian and the vertical circle through the star * or point. It is usually measured from the south point of the horizon through the west.

The poles P and P' are the intersections of the axis of the earth with the sphere. P is here the north pole. In consequence of the earth's rotation about its axis the stars appear to

^{*} That is, whose plane passes through the star.

describe small circles about P as the pole, apparently moving in the direction EQWQ'.

The equator EQWQ' is the great circle cut from the sphere by a plane through O perpendicular to the axis of the earth.

The latitude of the observer is the angular distance QZ from the equator to the zenith. Since $PQ = 90^{\circ}$ and $ZN = 90^{\circ}$, we have NP = QZ, i.e. the elevation of the pole above the horizon is equal to the latitude of the place.

The hour circle of a star is the great circle PSD through the star * and the pole. All the hour circles are perpendicular to the equator.

The hour angle of a star is the angle at the pole between the meridian and the hour circle of the star, measured from the meridian to the west. Thus the hour angle of S is -ZPS, negative since it is measured to the east. It is so named because, if the angle ZPS is 15° , one hour will elapse before PS coincides with PZ; for $15^{\circ} = 360^{\circ} \div 24$, and the star appears to make a complete revolution about P in 24 hours of sidereal (i.e. star) time.

The declination DS of a star is its angular distance from the equator, measured on its hour circle, and positive when the star is north of the equator.

The right ascension of a star is the angular distance along the equator from a certain point on the equator, called the vernal equinox, to the foot of the hour circle through the star, measured towards the east; or it is the angle at the pole between the hour circle of the vernal equinox and that of the star.

Hence the angle between the hour circles of two stars is equal to the difference between their right ascensions.

181. At a Place in Latitude 42° N. the Altitude of a Star, whose Declination is $+60^{\circ}$, was measured and found to be 50°, the Star being East of the Meridian. At what Time did the Star reach the Meridian? — In the triangle ZPS, $ZP=48^{\circ}$, $ZS=40^{\circ}$, $PS=30^{\circ}$; ... by Art. 148, $\frac{1}{2}ZPS=29^{\circ}55'.9$; ... $ZPS=59^{\circ}51'.8$ or $3^{h}59^{m}.5$. Hence the star reached the meridian $3^{h}59^{m}.5$ after the observation was made.†

^{*} That is, whose plane passes through the star. † Sidereal time.

182. The Latitude of the Place being 42° N., find the Interval of Time between the Rising of a Star above the Horizon and its Passage across the Meridian, its Declination being + 10°. - In the triangle ZPS, S will be on the horizon NEH at the instant of rising, so that $ZS = 90^{\circ}$.

$$\therefore \cos ZS = 0 = \cos ZP \cos SP + \sin ZP \sin SP \cos ZPS$$
.

$$\therefore$$
 cos $ZPS = -\cot ZP \cot SP = -\cot 48^{\circ} \cot 80^{\circ}$.

$$\therefore ZPS = 99^{\circ} 8'.1 \text{ or } 6^{h} 36^{m}.5.*$$

Hence the star will be above the horizon 13^h 13^m.0.*

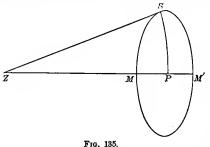

183. The Latitude of the Place being 42° N., and the Declination of the Star + 20°, find the Interval between the Instant when it is due East and that when it is due West. - In the triangle ZPS, $PZS = 90^{\circ}$.

$$\therefore$$
 cos $ZPS = \tan ZP \cot SP = \tan 48^{\circ} \cot 70^{\circ}$.

$$\therefore ZPS = 66^{\circ} 9'.4. \therefore 2ZPS = 132^{\circ} 18'.8 = 8^{h} 49^{m}.3.$$

Hence the interval required is 8^h 49^m.3.*

184. The Latitude being 42° N. and the Declination of the Star $+80^{\circ}$, find the Azimuth of the Star when it is at its Greatest Western Elongation; that is, when the Star has reached

its Farthest Distance towards the West, afterwards moving East. - In the figure the ZPS triangle is projected upon the plane of the horizon, so that Z is the zenith, P the pole, S the star, MSM' the apparent diurnal path of the star about the pole, ZP the meridian, ZS

the vertical circle of the star, and $\bar{P}ZS$ the angle required, the angle ZSP being a right angle.

^{*} Sidereal time.

 $\therefore \sin SP = \sin ZP \sin PZS.$ $\therefore \sin PZS = \sin 10^{\circ} \csc 48^{\circ};$ $PZS = 13^{\circ} 30'.8$.

Nore. — This is the method ordinarily used by the engineer to determine the north and south line.

185. The Right Ascensions of Two Stars are α and α' , and their Declinations δ and δ' ; find the Angular Distance between the Two Stars.

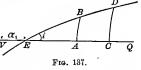

$$SP = 90^{\circ} - \delta$$
, $S'P = 90^{\circ} - \delta'$, $SPS' = \alpha' - \alpha$.

Hence we know two sides and the included angle, and we find the third side SS'by Art. 151 or by Art. 150.

186. If α' and α'' are the Right Ascensions, and δ' and δ'' the Declinations of Two Stars, find the Inclination to the Equator of

the Great Circle passing through the Stars, and also the Right Ascension of the Point where it cuts the Equator. -Let B and D be the two stars, EQthe equator, V the vernal equinox,

E the intersection of the great circle BD with the equator, $VE = \alpha_1$. In the right triangle EAB,

$$\sin EA = \tan AB \cot AEB$$
. $\therefore \cot i = \sin (\alpha' - \alpha_1) \cot \delta'$. (1)

In the right triangle ECD,

$$\sin EC = \tan CD \cot CED$$
. $\therefore \cot i = \sin (\alpha'' - \alpha_1) \cot \delta''$. (2)

$$\cdot \cdot \frac{\sin(\alpha'' - \alpha_{1})}{\sin(\alpha' - \alpha_{1})} = \frac{\cot \delta'}{\cot \delta''}$$

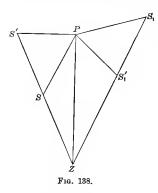

$$\cdot \cdot \frac{\sin(\alpha'' - \alpha_{1}) + \sin(\alpha' - \alpha_{1})}{\sin(\alpha'' - \alpha_{1}) - \sin(\alpha' - \alpha_{1})} = \frac{\cot \delta' + \cot \delta''}{\cot \delta' - \cot \delta''}$$

$$\cdot \cdot \frac{\tan \frac{1}{2}(\alpha'' + \alpha' - 2\alpha_{1})}{\tan \frac{1}{2}(\alpha'' - \alpha')} = \frac{\sin(\delta'' + \delta')}{\sin(\delta'' - \delta')}$$

$$\cdot \cdot \tan \frac{1}{2}(\alpha'' + \alpha' - 2\alpha_{1}) = \frac{\sin(\delta'' + \delta')}{\sin(\delta'' - \delta')} \tan \frac{1}{2}(\alpha'' - \alpha'). \quad (3)$$

From (3) find $\frac{1}{2}(\alpha'' + \alpha' - 2\alpha_1)$, thence finding α_1 ; then i may be found from either (1) or (2).

187. The Right Ascension and Declination of a Star are α and δ , and those of Another Star are α' and δ' ; find the Hour Angle of the First Star and their Common Azimuth when the Stars are

in the Same Vertical Circle, the Latitude of the Place being ϕ .—There are two positions, one when both stars are west, and the other when they are both east, of the meridian.

(1) $S'P = 90^{\circ} - \delta'$; $SP = 90^{\circ} - \delta$; $SPS' = \alpha - \alpha'$; $ZP = 90^{\circ} - \phi$. In the triangle SPS', find PS'S and PSS'. Then in the triangle S'PZ we know S'P, ZP, and PS'Z, and we find PZS' and ZPS'. In the triangle SPZ we know SP, ZP, and PSZ = SPZ

 $180^{\circ} - PSS'$, and we find PZS and ZPS.

The checks are PZS' = PZS, and $S'PZ - SPZ = \alpha - \alpha'$.

(2) $S_1P = 90^{\circ} - \delta$, $S_1'P = 90^{\circ} - \delta'$, $S_1PS_1' = \alpha - \alpha'$; find PS_1S_1' and $PS_1'S_1$, these angles being the same as those at S and S' in the first case. Then from the two triangles PS_1Z and $PS_1'Z$ we find the angles PZS_1 and PZS_1' , which should be identical, and also the angles S_1PZ and $S_1'PZ$, whose difference should be $\alpha - \alpha'$.

Note. — The well-known tables of Gauss, Becker, and Albrecht have been taken as the standards, the proof sheets have been read with great care, and it is believed that the number of errors cannot be large. The arrangement of the figures on the page is in accordance with that adopted in the standard six and seven place tables.

The natural tables were reduced from seven-place tables and compared with published five-place tables.

For convenience in using the tables, the explanation has been placed after them instead of before them.

II.

THE LOGARITHMS

OF THE

TRIGONOMETRIC FUNCTIONS

FOR EACH MINUTE.

Formulas for the Use of the Auxiliaries S and T.

1. When a is in the first five degrees of the quadrant:

$$\begin{aligned} \log \sin \alpha &= \log \alpha' + S.' \\ \log \tan \alpha &= \log \alpha' + T.' \\ \log \cot \alpha &= \operatorname{cpl} \log \tan \alpha. \end{aligned} & \log \alpha' &= \log \sin \alpha + \operatorname{cpl} S.' \\ &= \log \tan \alpha + \operatorname{cpl} T.' \\ &= \operatorname{cpl} \log \cot \alpha + \operatorname{cpl} T.' \\ \log \tan \alpha &= \log \alpha'' + T.'' \\ \log \cot \alpha &= \operatorname{cpl} \log \cot \alpha + \operatorname{cpl} T.'' \\ &= \operatorname{cpl} \log \cot \alpha + \operatorname{cpl} T.'' \\ &= \operatorname{cpl} \log \cot \alpha + \operatorname{cpl} T.'' \end{aligned}$$

2. When a is in the last five degrees of the quadrant:

$$\begin{split} \log\cos\alpha &= \log(90^\circ - \alpha)' + S.' \\ \log\cot\alpha &= \log(90^\circ - \alpha)' + T.' \\ \log\tan\alpha &= \operatorname{cpl}\log\cot\alpha. \end{split} \qquad \begin{aligned} \log(90^\circ - \alpha)' &= \log\cos\alpha + \operatorname{cpl}S.' \\ &= \log\cot\alpha + \operatorname{cpl}T.' \\ \log\cos\alpha &= \log(90^\circ - \alpha)'' + S.'' \\ \log\cot\alpha &= \log(90^\circ - \alpha)'' + T.'' \end{aligned} \qquad \begin{aligned} \log(90^\circ - \alpha)'' &= \log\cos\alpha + \operatorname{cpl}S.'' \\ &= \log\cot\alpha + \operatorname{cpl}T.'' \\ &= \operatorname{cpl}\log\tan\alpha + \operatorname{cpl}T.'' \end{aligned}$$

$$\alpha = 90^{\circ} - (90^{\circ} - \alpha).$$

Base of common logarithms

Base of Naperian logarithms (e) = 2.71828 18284 59045 23536

Com. Log. e = M (Modulus of Com. Logs.) = 0.43429 44819 03251 82765

Nap. Log. 10 = $\frac{1}{M}$ = 2.30258 50929 94045 68402

Com. Log. $N = M \times \text{Nap. Log. } N$. Nap. Log. $N = \frac{1}{M} \times \text{Com. Log. } N$ where N denotes any number.

$$\log \sin x = \log \tan x - M\left(\frac{1}{2}\tan^2 x - \frac{1}{4}\tan^4 x + \frac{1}{6}\sin^6 x + \frac{1}{8}\sin^8 x + \cdots\right).$$

^{*} n! denotes "factorial n," or the product $1 \cdot 2 \cdot 3 \cdot 4 \cdots n$.

[†] The angles are expressed in circular measure.

DIFFERENTIATION.

$$d(ax + b) = a dx, d(u \pm v) = du \pm dv, d(uv) = u dv + v du,$$

$$d\left(\frac{x}{y}\right) = \frac{y dx - x dy}{y^2}, d(x^n) = nx^{n-1} dx, d(\sqrt{x}) = \frac{dx}{2\sqrt{x}},$$

$$d(\log x) = M \frac{dx}{x}, d(a^x) = \frac{1}{M} a^x \log a dx, d(e^x) = e^x dx,$$

$$d(\sin x) = \cos x dx, d(\cos x) = -\sin x dx,$$

$$d(\sin x) = \sec^2 x dx, d(\cot x) = -\csc^2 x dx,$$

$$d(\sin x) = \sec x \tan x dx, d(\csc x) = -\csc x \cot x dx,$$

$$d(\sin^{-1} x) = \frac{dx}{\sqrt{1 - x^2}}, d(\tan^{-1} x) = \frac{dx}{1 + x^2}, d(\csc^{-1} x) = \frac{dx}{x\sqrt{x^2 - 1}},$$

$$d(\cos^{-1} x) = -\frac{dx}{\sqrt{1 - x^2}}, d(\cot^{-1} x) = -\frac{dx}{1 + x^2}, d(\csc^{-1} x) = -\frac{dx}{x\sqrt{x^2 - 1}},$$

$$d(\cot^{-1} x) = \frac{dx}{\sqrt{1 - x^2}}, d(\cot^{-1} x) = -\frac{dx}{1 + x^2}, d(\csc^{-1} x) = -\frac{dx}{x\sqrt{x^2 - 1}},$$

$$d(\cot^{-1} x) = -\frac{dx}{\sqrt{1 - x^2}}, d(\cot^{-1} x) = -\frac{dx}{1 + x^2}, d(\cot^{-1} x) = -\frac{dx}{x\sqrt{x^2 - 1}},$$

APPROXIMATE INTEGRATION.

Let Δx be the common distance between the ordinates $y_0, y_1, y_2, \dots y_n$, where n is even.

1.
$$\int f(x) dx = \frac{P+2Q}{3} - \frac{y_n''' - y_0'''}{180} \Delta x^4 + \frac{y_n^{\text{v}} - y_0^{\text{v}}}{1512} \Delta x^6 - \cdots,$$
where
$$P = \Delta x \left[y_0 + y_n + 2 \left(y_2 + y_4 + \cdots + y_{n-2} \right) \right],$$

$$Q = 2 \Delta x \left[y_1 + y_3 + \cdots + y_{n-1} \right],$$

$$Y_n''' = \frac{d^3}{dx^3} f(x) \text{ when } x = \text{abscissa of } y_n.$$

2. Simpson's rule:

$$A = \frac{\Delta x}{3} [y_0 + y_n + 2 (y_2 + y_4 + \dots + y_{n-2}) + 4 (y_1 + y_3 + \dots + y_{n-1})].$$

3. Weddle's rule (for seven ordinates):

$$A = \frac{3 \Delta x}{10} [y_0 + y_2 + y_4 + y_6 + y_8 + 5 (y_1 + y_8 + y_5)].$$

4. Prismoidal formula: $V = \frac{\Delta x}{3} [A + A' + 4 A_m] = \frac{h}{6} [A + A' + 4 A_m]$.

```

EXPLANATION OF THE TABLES.

INTRODUCTORY.

- 1. When we have a number with six or more decimal places, and we wish to use only five:
- (a) If the sixth and following figures of the decimal are less than 5 in the sixth place, they are dropped; thus, 0.46437 4999 is called 0.46437.
- (b) If the sixth and following figures of the decimal are greater than 5 in the sixth place, the fifth place is increased by unity and the sixth and following places are dropped; thus, 0.46437 5001 is called 0.46438.
- (c) If the sixth figure of the decimal is 5, and if it is followed only by zeros, make the fifth figure the nearest even figure; thus, 0.46437 500 is called 0.46438, while 0.46438 500 is also called 0.46438. The number is thus increased when the fifth figure is odd, and decreased when it is even, the two operations tending to neutralize each other in a series of computations, and hence to diminish the resultant error.
- 2. Hence any number obtained according to Art. 1 may be in error by half a unit in the fifth decimal place.
- 3. When the last figure of a number in these tables is $\overline{5}$, the number printed is too large, the 5 having been obtained according to Art. r(b); if the 5 is without the minus sign, the number printed is too small, the figures following the 5 having been dropped according to Art. r(a).
- 4. The marginal tables contain the products of the numbers at the top of the columns by 1, 2, 3, \cdots 9 tenths, and may be used in multiplying and dividing in interpolation.

(a) To multiply 38 by .746:

$$38 \times .7 = = 26.6$$

$$38 \times .4 = 15.2; \therefore 38 \times .04 = 1.52$$

$$38 \times .6 = 22.8; \therefore 38 \times .006 = 22.8$$

$$\therefore 38 \times .746 = 28.348$$

$$38 \times .746 = 28.348$$

$$38 \times .746 = 28.348$$

In multiplying by the second figure (hundredths), the decimal point in the table is moved *one* place to the left; in multiplying by the third (thousandths), two to the left; and so on.

(b) To divide 28 by 38:

	Dividend,	28				38
	Next less,	26.6	corresponding to	.7	I 2	3.8 7.6
	Remainder,	14			3	11.4
	Next less,	1 1.4	corresponding to	.03	5	19.0
	Remainder,	26			7	22.8 26.6
	Nearest,	2 6.6	corresponding to	.007	8	30.4 34.2
٠.	Quotient,			.737	7 1	J-1"-

to the nearest third decimal place. The decimal point is moved one place to the right in each remainder, since the next figure in the quotient will be one place farther to the right.

To divide 23 by 38:

The computer should use the marginal tables mentally.

LOGARITHMS.

- 5. The logarithm of a number is the exponent of the power to which a given number called the *base* must be raised to produce the first number. If $A = e^a$, a is called the logarithm of the number A to the base e, written $\log_e A = a$.
- 6. If $A = e^a$, and $B = e^b$, or (omitting subscripts) $\log A = a$, and $\log B = b$, we have

$$A \times B = e^{a+b}; \quad \therefore \log(A \times B) = a+b; \quad \therefore \log(A \times B) = \log A + \log B.$$

$$A \div B = e^{a-o}; \quad \therefore \log(A \div B) = a-b; \quad \therefore \log(A \div B) = \log A - \log B.$$

$$A^n = e^{na}; \quad \therefore \log(A^n) = na; \quad \therefore \log(A^n) = n \log A.$$

$$\sqrt[n]{A} = e^{\frac{1}{n}a}; \quad \therefore \log^{\frac{n}{A}} = \frac{1}{n} \log A.$$

7. When the base is not specified, it is generally understood that logarithms to the base 10, or *common logarithms*, are meant. In this system, since

$$0.001 = \frac{1}{1000} = \frac{1}{10^3} = 10^{-3}, \quad \log 0.001 = -3;$$

$$0.01 = \frac{1}{100} = \frac{1}{10^2} = 10^{-2}, \quad \log 0.01 = -2;$$

$$0.1 = \frac{1}{10} = \frac{1}{10} = 10^{-1}, \quad \log 0.1 = -1;$$

$$1. = 10^0, \quad \log 1 = 0;$$

$$10. = 10^1, \quad \log 10 = +1;$$

$$100. = 10^2, \quad \log 100 = +2;$$

$$1000. = 10^3, \quad \log 1000 = +3.$$

8. The logarithm of a number between 100 and 1000 will be a number between 2 and 3, or z + m where m will be a decimal called the mantissa, the integral portion of the logarithm being the characteristic. The mantissa is always considered positive; thus $\log 0.002$ will be a number between -2 and -3, that is, either -3 + m or -2 - m', the first form being used. We write $\log 0.002 = \overline{3}.30103$, the negative sign being placed over the characteristic to show that the characteristic alone is negative.

9. Since

 $\log (A \times 10^n) = \log A + \log 10^n = \log A + n \log 10 = \log A + n,$ and $\log (A \div 10^n) = \log A - \log 10^n = \log A - n \log 10 = \log A - n,$ we have, if $\log 37.3 = 1.57171$,

$$\log 373$$
. = 2.57171, and $\log 3.73$ = 0.57171, $\log 3730$ = 3.57171, and $\log 0.373$ = $\overline{1}.57171$; $\log 37300 = 4.57171$, and $\log 0.0373 = \overline{2}.57171$.

Hence the position of the decimal point affects the characteristic alone, the mantissa being always the same for the same sequence of figures. For this reason the common system of logarithms is used in practice.

- 10. The characteristic is found as follows: When the number is greater than 1, the characteristic is positive, and is one less than the number of digits to the left of the decimal point; when the number is less than 1, the characteristic is negative, and is one more than the number of zeros between the decimal point and the first significant figure.
- 11. To avoid the use of negative characteristics we add 10 to the characteristic and write -10 after the mantissa, *i.e.* adding and subtracting the same quantity, 10. Thus $\log 0.2 = \bar{1}.30103$ would be written

9.30103 - 10. The -10 is often omitted for brevity when there is no danger of confusion, but its existence must not be forgotten. Such logarithms are called *augmented* logarithms.

In this case the characteristic of the logarithm of a pure decimal is 9 diminished by the number of ciphers to the left of the first significant figure. Thus the characteristic of $\log 0.004$ is 9-2, or 7, and that of $\log 0.94$ is 9-0, or 9.

12. The arithmetical complement of the logarithm (written colog) of a number is the logarithm of its reciprocal, and is found by subtracting each figure of the logarithm from 9, commencing at the left, except the last significant figure on the right, which is subtracted from 10.

For
$$\log \frac{1}{x} = -\log x = 10 - \log x - 10$$
;
thus, if $\log x = 2.46403$, $\operatorname{colog} x = 7.53597 - 10$;
if $\log x = 8.43000 - 10$, $\operatorname{colog} x = 1.57000$.

TABLE I.

13. Page 3 contains the logarithms of numbers from 1 to 100, to five decimal places.

Pages 4-21 contain the mantissas of the logarithms of numbers from 1000 to 10009, to five decimal places.

Pages 22, 23, contain the mantissas of the logarithms of numbers from 10000 to 11009, to seven decimal places.

NOTE. — The mantissas of the logarithms of numbers, except those of the integral powers of 10, are incommensurable, the mantissas in the tables being found as shown in Art. 1.

To find the Logarithm of a Number.

- 14. The *characteristic* is found by the rules in Arts. 10 and 11, and the *mantissa* from the tables, as shown in Arts. 15, 16, 17, 18.
- 15. When the number has four figures. Find on pages 4-21 the first three figures in the column marked N, and the fourth at the top of one of the other columns. The last three figures of the mantissa are found in this column on the horizontal line through the first three figures of the given number in column N. The first two figures of the mantissa are those under L in the same line with the number, or else those nearest above it, unless the last three figures of the mantissa as given in the tables are preceded by a *, when the first two figures are found under L in the first line below the number. Thus (page 4),

$$\log 1136 = 3.05538$$
; $\log 1137 = 3.05576$; $\log 1138 = 3.05614$; $\log 1370 = 3.13672$; $\log 1371 = 3.13704$; $\log 1372 = 3.13735$; $\log 1380 = 3.13988$; $\log 1381 = 3.14019$; $\log 1382 = 3.14051$.

16. When the number has less than four figures, annex ciphers on the right and proceed as in Art. 15. Thus,

```
\log 1.13 = 0.05308; \log 12.8 = 1.10721; \log 130 = 2.11394; \log 15 = 1.17609; \log 16 = 1.20412; \log 17 = 1.23045.
```

17. When the number has more than four figures, as 11.4672.— Since the mantissa is independent of the position of the decimal point, point off the first four figures and find the mantissa of log 1146.72. This will be between the mantissas of log 1146 and log 1147. Hence find from the tables the mantissas corresponding to 1146 and 1147; multiply the difference between them (called the tabular difference) by .72, and add the product (called the correction) to log 11.46; the result will be the logarithm required.

NOTE. — Since any mantissa in the tables may be in error by half a unit in the fifth decimal place (Art. 2), no advantage is gained by using the sixth place in the interpolated logarithm. Thus, according to Art. 1, we drop the .36, and call log 11.4672 = 1.05945.

NOTE. — The marginal tables should be used in multiplying the tabular difference to find the correction (Art. 4).

Note. — It is assumed that the change in the mantissa is proportional to that in the number, as the latter increases from 1146 to 1147. An increase of 1 in the number causes an increase of 38 in the mantissa; bence an increase of .72 in the number will cause an increase of $38 \times .72$ in the mantissa.

NOTE. — We could also find the mantissa of $\log 11.4672$ by subtracting the product of the tabular difference by .28 (or 1.00-.72) from the mantissa corresponding to 1147; that is, the required mantissa is $05956-(38\times.28)=05956-10.64=05945$ as before.

18. The general rule is: Find the mantissa corresponding to the first four figures of the number; multiply the tabular difference by the fifth and following figures treated as a decimal; and add the product to the mantissa just found.

The tabular difference is the difference between the mantissas corresponding to the two numbers in the tables, between which the given number lies.

```
\begin{array}{l} \log 1.62163 = 0.20995 \; ; \; \log 0.38024 = \overline{1}.58006 \; ; \; \log 0.0852763 = \overline{2}.93083 \; ; \\ \log 189.524 = 2.27767 \; ; \; \log 0.38602 = \overline{1}.58661 \; ; \; \log 0.0085938 = \overline{3}.93419 \; ; \\ \log 19983.4 = 4.30067 \; ; \; \log 3.98743 = 0.60070 \; ; \; \log 0.090046 \; = \overline{2}.95446. \end{array}
```

NOTE. — Page 3 is used when the number contains less than three figures, the number being found in the column N, and the logarithm in the column headed Log. The characteristic is given for whole numbers, and must be changed for decimals.

Note. — When a number is composed of three figures, find on pages 4-21 the number in the column N, and the mantissa corresponding in the column L. o.

To find the Number corresponding to a Given Logarithm.

- 19. From the tables we find the sequence of figures corresponding to the given mantissa, as shown in Arts. 20, 21, and 22, the position of the decimal point being determined by the characteristic (Arts. 10, 11).
- 20. When the given mantissa can be found in the tables.— Find on pages 4-21 the first two figures of the mantissa under L in the column headed L. o. The last three figures of the mantissa are then sought for in the columns headed o, 1, 2, ... 9, in the same line with the first two figures, or in one of the lines just below, or in the line next above (where they would be preceded by a *). The first three figures of the required number will be found in the column headed N, in the same horizontal line with the last three figures of the mantissa, and the fourth figure of the number at the top of the column in which the last three figures of the mantissa are found. Thus (page 4),

```
0.06221 = \log 1.154; 0.06558 = \log 1.163; 0.06893 = \log 1.172; 0.07004 = \log 1.175; 0.07188 = \log 1.180; 0.08063 = \log 1.204.
```

21. When the given mantissa can not be found in the tables.—If we wish to find the number whose logarithm is 2.16531, we enter the tables with 16531, and find that it lies between 16524 and 16554, so that the given mantissa corresponds to a number between 1463 and 1464. Also 16531 exceeds 16524 by 7, and this difference, divided by the tabular difference 30, gives .23... as the amount by which the required number exceeds 1463. Hence 2.16531 = log 146.323..., which we call 146.32, according to Art. 1, the incompleteness of the tables making the sixth figure uncertain.

NOTE. —The marginal tables should be used in dividing the difference between the given mantissa and the one next less in the tables by the tabular difference.

22. The general rule is: Find the number corresponding to the mantissa in the tables next less than the given mantissa; divide the excess of the given mantissa over the one found in the tables by the tabular difference; and annex the quotient to the first four figures already found.

The tabular difference is the difference between the two mantissas in the tables, between which the given mantissa lies.

```
\overline{1}.16600 = \log 0.14656; 0.18002 = \log 1.5136; 2.18200 = \log 152.06; 1.19000 = \log 15.488; 4.19680 = \log 15773; 1.20020 = \log 15.856.
```

23. For the use of the numbers S', T', S'', T'', see Arts. 35-38.

TABLE II.

- 24. This table (pages 26-70) contains the logarithms, to five decimal places, of the trigonometric sines, cosines, tangents, and cotangents of angles from 0° to 90°, for each minute. The logarithms in the columns headed L. Sin, L. Tan, and L. Cos, are augmented, and should be diminished by 10 (Art. 11), while those in the columns headed L. Cot are correctly given.
- 25. Since $\sec x = \frac{1}{\cos x}$, and $\csc x = \frac{1}{\sin x}$, the logarithms of the secant and cosecant of an angle are the arithmetical complements of those of the cosine and sine respectively (Art. 12).

To find the Logarithmic Functions of an Angle Less than 90°.

26. When the angle is less than 45°, the degrees are found at the top of the page, and the minutes on the left. The numbers in the same horizontal line with the minutes of the angle are the logarithmic functions indicated by the notation at the top of the columns. Thus (page 34),

$$\log \sin 8^{\circ} 4' = 9.14714 - 10$$
, $\log \tan 8^{\circ} 4' = 9.15145 - 10$, $\log \cot 8^{\circ} 4' = 0.8485\overline{5}$, $\log \cos 8^{\circ} 4' = 9.99568 - 10$.

27. When the angle is greater than 45°, the degrees are found at the bottom of the page, and the minutes on the right. The numbers in the same horizontal line with the minutes of the angle are the logarithmic functions indicated by the notation at the bottom of the columns. Thus (page 34),

log sin
$$81^{\circ} 25' = 9.99511 - 10$$
, log tan $81^{\circ} 25' = 0.82120$, log cot $81^{\circ} 25' = 9.17880 - 10$, log cos $81^{\circ} 25' = 9.17391 - 10$.

28. When the angle is given to decimals of a minute.—In finding log sin 30° 8'.48, for example, we see that it will lie between the logarithmic sines of 30° 8' and 30° 9', that is, between 9.70072 and 9.70093, their difference 21 being the change in the logarithmic sine caused by a change of 1' in the angle. Hence, to find the correction to log sin 30° 8' that would give log sin 30° 8'.48 we multiply 21 by .48 (Art. 4). The product 10.08 added to log sin 30° 8', since log sin 30° 9' is greater than log sin 30° 8', gives log sin 30° 8'.48 = 9.70082 (Art. 1). Similarly, log tan 30° 8'.48 = 9.76391, log cot 30° 8'.48 = 0.23609, log cos 30° 8'.48 = 9.93691, the correction being subtracted in the last two cases, since the cotangent and the cosine decrease as the angle increases.

29. The general rule is: Find the function corresponding to the given degrees and minutes; multiply the tabular difference by the decimals of a minute; add the product to the function corresponding to the given degrees and minutes when finding the logarithmic sine or tangent, and subtract it when finding the logarithmic cosine or cotangent.

The tabular differences are given in the columns headed d. and c. d., the latter containing the common difference for the L. Tan and L. Cot columns. The difference to be used is that between the functions corresponding to the two angles between which the given angle lies.

```
For 30^{\circ} 39' .38: \log \sin = 9.70747; \log \cos = 9.93462; \log \tan = 9.77285; \log \cot = 0.22715.
For 59^{\circ} 43' .46: \log \sin = 9.93632; \log \cos = 9.70257; \log \tan = 0.23375; \log \cot = 9.76625.
```

30. When the angle is given to seconds, the correction may be found by multiplying the tabular difference by the number of seconds, and dividing the product by 60.

To find the Acute Angle corresponding to a Given Logarithmic Function.

- 31. The column headed L. Sin is marked L. Cos at the bottom, while that headed L. Cos is marked L. Sin at the bottom; hence, if a logarithmic sine or cosine were given, we should expect to find it in one of these two columns. Similarly, we should expect to find a given logarithmic tangent or cotangent in one of the two columns headed L. Tan and L. Cot.
- 32. When the function can be found in the tables. If a logarithmic sine is given, find it in one of the two columns marked L. Sin and L. Cos; if found in the column headed L. Sin, the degrees are taken from the top, and the minutes from the left of the page; if in the column headed L. Cos but marked L. Sin at the bottom, the degrees are taken from the bottom, and the minutes from the right of the page. Thus,

```
9.70115 = \log \sin 30^{\circ} 10'; 9.93457 = \log \sin 59^{\circ} 20';
9.93724 = \log \cos 30^{\circ} 4'; 9.70590 = \log \cos 59^{\circ} 28';
9.76406 = \log \tan 30^{\circ} 9'; 0.23130 = \log \tan 59^{\circ} 35';
0.23420 = \log \cot 30^{\circ} 15'; 9.76870 = \log \cot 59^{\circ} 35'.
```

33. When the function can not be found in the tables. — If we wish to find the angle whose logarithmic sine is 9.70170, we see on page 56 that the given logarithmic sine lies between 9.70159 and 9.70180, and

hence the angle is between 30° 12′ and 30° 13′. The given logarithmic sine differs from log sin 30° 12′ by 11, and this difference, divided by the tabular difference 21, gives .52 + as the decimal of a minute by which the angle exceeds 30° 12′. Hence 9.70170 = log sin 30° 12′.52, which we call 30° 12′.5, since the incompleteness of the tables (Art. 1) makes the hundredths of a minute uncertain.

34. The rule is: For a logarithmic sine or tangent find the degrees and minutes corresponding to the function in the tables next less than the given function; divide the difference between the given function and the one next less by the tabular difference; and the quotient will be the decimal of a minute to be added to the degrees and minutes already found. For a logarithmic cosine or cotangent find the degrees and minutes corresponding to the function next greater than the given function, since the cosine and cotangent decrease as the angle increases, and divide the difference between the given function and the one next greater by the tabular difference, to find the decimal of a minute.

The tabular difference is the difference between the two functions in the tables, between which the given function lies.

```
9.70000 = log sin 30° 4'.7; 9.93500 = log sin 59° 25'.7;

9.93400 = log cos 30° 47'.6; 9.70500 = log cos 59° 32'.2;

9.77000 = log tan 30° 29'.5; 0.23200 = log tan 59° 37'.4;

0.23300 = log cot 30° 19'.1; 9.76400 = log cot 59° 51'.2.
```

Angles Near oo or 90°.

- 35. The assumption that the variations in the functions are proportional to the variations in the angles if the latter are less than 1' fails when the angle is small, shown by the rapid changes in the tabular differences on pages 26, 27, and 28.
- 36. The quantities S' and T' which are used in this case are defined by the equations

$$S' = \log \frac{\sin \alpha}{\alpha'},$$

$$T' = \log \frac{\tan \alpha}{\alpha'},$$

where α' is the number of minutes in the angle. Their values from 0° to 1° 40' (=100') are given at the bottom of pages 3-21; from 1° 40' to 3° 20' at the left margin of pages 4 and 5, the first three figures being found at the top; and from 3° to 5° on page 24. Thus,

for
$$I' = I'$$
 (page 5), $S' = 6.46\ 373$, $T' = 6.46\ 373$; for $I_5' = I_5'$ (page 5), $S' = 6.46\ 372$, $T' = 6.46\ 373$; for $I_5' = I_60'$ (page 5), $I_5' = 6.46\ 357$, $I_5' = 6.46\ 404$; for $I_5' = I_60'$ (page 24), $I_5' = 6.46\ 331$, $I_5' = 6.46\ 456$. Each of these numbers should have $I_5 = I_5$ written after it (Art. II).

Note. — The logarithmic cosine of a small angle is found by the ordinary method. The cotangent of an angle is the reciprocal of the tangent, and hence the logarithmic cotangent is the arithmetical complement of the logarithmic tangent. The formulas for finding the logarithmic cosine, tangent, and cotangent of angles near 90° are given on page 25.

37. To find the logarithmic sine or tangent of a small angle. — From Art. 36, we have

$$\log \sin \alpha = S' + \log \alpha',$$
$$\log \tan \alpha = T' + \log \alpha'.$$

Hence, to find the logarithmic sine or tangent of an angle less than 5° , find the value of the S' or T' corresponding to the angle, interpolating if necessary, and add it to the logarithm of the number of minutes in the angle.

Find log sin o° 42'.6. Since the angle is nearer 43' than 42', we take

$$S' = 6.46 \ 371$$

$$\log 42.6 = 1.62 \ 941$$

$$\therefore \log \sin 0^{\circ} 42'.6 = 8.09 \ 312$$

Find log tan $1^{\circ}53'.2$. Since the angle is nearer $1^{\circ}53'$ (= 113') than 114', we take

$$T' = 6.46 388$$

 $\log 113.2 = 2.05 385$
 $\therefore \log \tan 1^{\circ} 53'.2 = 8.51 773$

NOTE. — When the angle is given in seconds, either reduce the seconds to decimals of a minute, or use the values of S^{II} and T^{II} given at the bottom of pages 3-23 and on page 24. They are defined by the equations

$$S^{\prime\prime} = \log \frac{\sin \alpha}{\alpha^{\prime\prime}}$$
, and $T^{\prime\prime} = \log \frac{\tan \alpha}{\alpha^{\prime\prime}}$,

where a^{II} is the number of seconds in the angle. Hence

 $\log \sin \alpha = S'' + \log \alpha''$, and $\log \tan \alpha = T'' + \log \alpha''$.

38. To find the small angle corresponding to a given logarithmic sine or tangent. — From Art. 36,

$$\begin{aligned} \log \alpha' &= \log \sin \alpha - S', \\ \log \alpha' &= \log \tan \alpha - T', \end{aligned}$$

$$\log \alpha' &= \log \sin \alpha + \operatorname{cpl} S', \\ \log \alpha' &= \log \tan \alpha + \operatorname{cpl} T'. \end{aligned}$$

or $\log \alpha' = \log \alpha'$

When the angle is less than 3°, find on pages 26-28 the value of cpl S' (or cpl T') corresponding to the function, interpolating if necessary, and add it to log sin α (or log tan α); the sum will be the logarithm of the number of minutes in the angle.

In finding the angle whose logarithmic sine is 8.09006, we see from

the *L. Sin* column (page 26) that the angle is between 0° 42' and 0° 43', and that the value of cpl S' must be either 3.53628 or 3.53629. The given logarithmic sine is nearer that of 42' than that of 43'; hence we take

cpl
$$S' = 3.53628$$

 $\log \sin \alpha = 8.09006$
 $\log \alpha' = 1.62634$ $\therefore \alpha' = 42'.300$.

When the angle is between 3° and 5° , we may find S' and T' from page 24 after finding the angle approximately from pages 29 and 30. Thus in finding the angle whose logarithmic tangent is 8.77237 we find from page 29 that the angle is between $3^{\circ}23'$ and $3^{\circ}24'$, being nearer $3^{\circ}23'$. Then on page 24 we have

$$T' = 6.46423$$

$$\log \tan \alpha = 8.77237$$

$$\therefore \log \tan \alpha - T' = \log \alpha' = \frac{2.30814}{2.30814} \therefore \alpha' = 203'.30 = 3^{\circ} 23'.30.$$

Angles Greater than 90°.

39. To find the logarithmic sine, cosine, tangent, or cotangent of an angle greater than 90°, subtract from the given angle the largest multiple of 90° contained therein. If this multiple is even, find from the tables the logarithmic sine, cosine, tangent, or cotangent of the remaining acute angle. If the multiple is odd, the logarithmic cosine, sine, cotangent, or tangent, respectively, of the remaining acute angle will be the function required; thus, $\sin 120^\circ = \sin (90^\circ + 30^\circ) = \cos 30^\circ$.

<i>x</i> =	I. QUADRANT.	II. QUADRANT.	III. QUADRANT.	IV. QUADRANT. 270°+a
$\sin x =$	+ sin a	+ cos α	— sin α	— cos α
$\cos x =$	+ cos α	— sin α	— cos α	$+\sin a$
$\tan x =$	+ tan a	— cot a	+ tan a	− cot a
$\cot x =$	+ cot a	— tan α	+ cot a	— tan α

Or we could find the difference between the angle and 180° or 360° , and find from the tables the same function of the remaining acute angle; thus, $\cos 300^{\circ} = \cos (360^{\circ} - 60^{\circ}) = \cos 60^{\circ}$, etc.

x =	I. QUADRANT.	II. QUADRANT.	III. QUADRANT.	IV. QUADRANT. 360°-a or -a
sin x = cos x = tan x = cot	+ sin a + cos a + tan a + cot a	+ sin a cos a tan a cot a	- sin α - cos α + tan α + cot α	— sin α + cos α — tan α — cot α

To indicate that the trigonometric function is negative, n is written after its logarithm.

- 40. To find the angle corresponding to a given function, find the acute angle α corresponding thereto, and the required angle will be α , $180^{\circ} \pm \alpha$, or $360^{\circ} \alpha$, according to the quadrant in which the angle should be placed.
- 41. There are always two angles less than 360° corresponding to any given function. Hence there will be ambiguity in the result unless some condition is known that will fix the angle; thus, if the sine is positive, the angle may be in either of the first two quadrants, but if we also know that the cosine is negative, the angle must be in the second quadrant.

Given One Function of an Angle, to find Another without finding the Angle.

42. Suppose log tan $\alpha=9.79361$, and log cos α is sought. On page 57 the tabular difference for log tan α is 28, and that for log cos α is 8, the given logarithmic tangent exceeding 9.79354 by 7. Hence 28:7=8:x; $\therefore x=\frac{8}{28}\times 7=z=$ correction to 9.92905, giving log cos $\alpha=9.92903$.

In the margin are tables to facilitate the process. In the column headed $\frac{8}{28}$, the numerator is the tabular difference for the column headed L. Cos, and the denominator that for the logarithmic tangents. The numbers in the marginal column are the values of Δ ,—the excess of log tan α over the next smaller logarithmic tangent, found in the tables,—such that $\frac{8}{28}\Delta$ shall be 0.5, 1.5, 2.5, etc.; and the numbers on the left are the corrections x to be applied to the numbers in the column headed L. Cos. Thus, if Δ is between 1.8 and 5.2, x is between 0.5 and 1.5, and is called 1. Note that 1 is opposite the space between 1.8 and 5.2. In the example above, the excess Δ is 7, which lies between 5.2 and 8.8; hence x is 2, the number on the left opposite the space between 5.2 and 8.8.

For example, if we have given the logarithms of the sides of a right-angled triangle, $\log a = 2.98227$ and $\log b = 2.90255$, to find the hypotenuse, we use the formulas

$$\tan \alpha = \frac{a}{b}$$
, and $c = \frac{a}{\sin \alpha} = \frac{b}{\cos \alpha}$

 $\log a = 2.98227 (1)$

:. $\log \sin \alpha = 9.88571$ (4)

 $\log b = 2.90255$ (2)

:. $\log \tan \alpha = 0.07972$ (3)

 $\log c = 3.09656$ (5)

The value of log tan α being found in the column marked L. Tan at the bottom, the right column will contain the logarithmic sine of the corresponding angle. Also, the correction to 9.88563 is $20 \times \frac{1}{2} \frac{0}{6}$, which we find to be 8 from the table headed $\frac{1}{2} \frac{0}{6}$.

TABLE III.

43. This table (pages 72-94) contains the "natural" or actual numerical values of the trigonometric sines, cosines, tangents, and cotangents of angles from 0° to 90°, for each minute, while Table II. contains the logarithms of these numbers.

NOTE. -- The secant is the reciprocal of the cosine, and the cosecant of the sine.

The arrangement and method of using the table are the same as those for Table II., except that the tabular differences are not printed. For the sake of clearness the first figures of the functions are given only opposite each fifth minute, and also when they change. Arts. 26, 27, 29, 30, 31, 32, and 34* will explain the table if the word "logarithmic" be changed to "natural," and "L. Sin," etc., to "N. Sin," etc.

```
\sin 20^{\circ} \text{ 1o'} = 0.34475; \cos 20^{\circ} \text{ 1o'} = 0.93869;

\tan 20^{\circ} \text{ 1o'} = 0.36727; \cot 20^{\circ} \text{ 1o'} = 2.7228.

\sin 68^{\circ} \text{ 1o'} = 0.92827; \cos 68^{\circ} \text{ 1o'} = 0.37191;

\tan 68^{\circ} \text{ 1o'} = 2.4960; \cot 68^{\circ} \text{ 1o'} = 0.4006\overline{5}.
```

In finding $\sin 68^{\circ}$ 24'.4 we see that the required sine lies between 0.92978 and 0.92988, the tabular difference being 10; the correction for 0'.4 is $10 \times .4 = 4$; hence $\sin 68^{\circ}$ 24'.4 = 0.92978 + 4 units in the fifth place = 0.92982.

In finding $\cot 68^{\circ}$ 20'.4 we see that the required cotangent lies between 0.39727 and 0.39694, the tabular difference being 33; the correction for 0'.4 is $33 \times .4 = 13.2$; hence $\cot 68^{\circ}$ 20'.4 = 0.39727 - 13 units in the fifth place = 0.39714.

NOTE.—The correction is added for the sine and tangent because they increase as the angle increases, and subtracted for the cosine and cotangent since they decrease as the angle increases.

In finding the angle whose tangent is 0.39870, the required angle will lie between 21° 44' and 21° 45', the tabular difference being 39896 – 39862 = 34, while the given tangent exceeds that of 21° 44' by 39870 – 39862 = 8. Hence $8 \div 34$ or 0'.2+ is the correction to be added to 21° 44', giving 21° 44'.2 for the angle required.

In finding the angle whose cosine is 0.36850, the required angle will lie between 68° 22' and 68° 23', the tabular difference being 36867 - 36839 = 28, while the given cosine is less than $\cos 68^{\circ}$ 22' by 36867 - 36850 or 17. Hence $17 \div 28$ or 0'.6+ is the correction to be added to 68° 22', giving 68° 22'.6 for the angle required.

^{*} The examples in these articles apply only to Table II.

TABLE IV.

44. Circular arcs with radius unity. (Page 95.) — To find the length of the arc of 61° 42′ 35″.2 in a circle whose radius is 200 feet, we find that in the circle whose radius is unity,

Arc of $61^{\circ} = 1.06465 \text{ o8}$ Arc of 42' = 0.01221 73Arc of 35'' = 0.00016 97Arc of 0''.2 = 0.00000 10

.. Arc of 61° 42' 35''.2 = 1.07703 88* feet in the circle whose radius is 1 foot, and if the radius is 200 feet the length of the arc will be 1.07703 88 × 200.

To find the angle at the center of a circle with radius 3, the length of its intercepted arc being 13.39410 00: the length of its intercepted arc in the circle whose radius is unity will be $\frac{1}{3} \times 13.39410$ 00 = 4.46470 00.

* Owing to the incompleteness of the table the last figure will probably be erroneous.

TABLE V.

45. Conversion of common logarithms into Naperian, and vice verså (page 96). — We have

$$\log_{10} N = M \log_e N$$
, and $\log_e N = \frac{1}{M} \log_{10} N$.

Table V. contains the multiples of M and $\frac{1}{M}$ by numbers from 1 to 100.

Find the common logarithm of 2, its Naperian logarithm being 0.69314 718056.

$$\begin{array}{lll} M \times .69 & = 0.29966\ 31925 \\ M \times .0031 & = .00134\ 63128\ 94 \\ M \times .000047 & = .00002\ 04118\ 41 \\ M \times .00000018 & = .00000\ 00002\ 17 \\ M \times .00000000006 & = .00000\ 00000\ 26 \\ & \therefore \log_{10} 2 = 0.30102\ 99956\ 51 \end{array}$$

(True value = 0.3010299957)

Find the Naperian logarithm of 0.2, its common logarithm being 9.3010299957-10. Hence the true logarithm is

$$\log_{10} 0.2 = -1 + .3010299957 = -0.6989700043.$$

$$\frac{1}{M} \times .69 = 1.58878 \ 37142$$

$$\frac{1}{M} \times .0089 = .02049 \ 30073 \ 28$$

$$\frac{1}{M} \times .000070 = .00016 \ 11809 \ 57$$

$$\frac{1}{M} \times .0000000043 = \frac{.00000 \ 00099 \ 01}{1.60943 \ 79123 \ 86}$$

$$(\text{True value} = -1.60943 \ 79124)$$
